

# MailEnable PowerShell Reference

2<sup>nd</sup> June 2023

## Overview

MailEnable's PowerShell interface allows system administrators and developers to manage MailEnable via PowerShell.

Administrators can perform typical actions via scripts and can develop and extend these to these commands via scripting. PowerShell significantly improves automation and integrated management of MailEnable.

PowerShell support is available for all editions of MailEnable since version 9.5.

## Launching PowerShell

You can launch PowerShell either by:

1. Selecting **Windows PowerShell** from the Start screen, or:
2. Selecting **Windows PowerShell** from the taskbar.

## Executing MailEnable PowerShell Commands

Once PowerShell opens, use the following command to add the MailEnable PowerShell snap-in to the current PowerShell session:

*Add-PSSnapin MailEnable.Provision.Command*

You can then issue specific commands depending on the area of MailEnable you wish to configure. You can add this to your PowerShell profile so this line is not needed each time.

The first command to issue is the Help command. It provides a comprehensive list of the settings that can be manipulated via PowerShell.

Example: *PS> Get-MailEnablePlatform -Help "\*"*

The asterisk tells PowerShell to return all settings.

You can also filter them by simply providing part of the setting name.

Example: *PS>Get-MailEnablePlatform -Help "Skin"*

```
SettingId      : sysSkinCatalogueEnabled
SettingType    : MailEnablePlatform
SettingDataType : dword
SettingControl : 0=Disabled, 1=Enabled
Purpose        : Determines whether the Management Console shows an online skin catalogue
```

The Help command returns the SettingId (the name of the setting), and the SettingType (which is the Command that is used to Set it).

PowerShell Commands are prefixed with the action you wish to perform, i.e.: New, Get, Set, Remove, etc.

As such, to enable the Skin Catalogue within MailEnable, you would execute the following command:

*Set-MailEnablePlatform -Setting sysSkinCatalogueEnabled -Value 1*

## MailEnable PowerShell Command Overview

MailEnable's PowerShell interface is compact but provides the ability to change thousands of settings. It provides the following cmdlets, each of which can be passed parameters to perform configuration changes.

The platform cmdlets manage server wide settings and options, such as service configuration:

Get-MailEnablePlatform

Set-MailEnablePlatform

The postoffice cmdlets manage postoffices and their settings:

Get-MailEnablePostoffice

Set-MailEnablePostoffice

Add-MailEnablePostoffice

Remove-MailEnablePostoffice

The mailbox cmdlets manage users and their settings:

Get-MailEnableMailbox

Set-MailEnableMailbox

Add-MailEnableMailbox

Remove-MailEnableMailbox

The domain cmdlets manage domain settings:

Get-MailEnableDomain

Set-MailEnableDomain

Add-MailEnableDomain

Remove-MailEnableDomain

The address map cmdlets:

MailEnableAddressMap - manage email addresses

The group cmdlets:

MailEnableGroup - manage distribution groups

The group member cmdlets:

MailEnableGroupMember - manage distribution group membership

The list cmdlets:

MailEnableList - manage distribution lists

The list member cmdlets:

MailEnableListMember - manage distribution group membership

Access and Relay cmdlets that control access to POP and SMTP and SMTP relay rights:

Get-MailEnableAccess

Set-MailEnableAccess

Add-MailEnableAccess

Remove-MailEnableAccess

Share configuration cmdlets that control folder sharing

Get-MailboxFolderPermission

Add-MailboxFolderPermission

## MailEnable PowerShell Commands

### Get-MailEnableAccess

This returns the IP objects for the access control for POP and SMTP services as well as the IP relay control. The relay control is shown in the administration program under the SMTP->Relay options as **Privileged IPs**. The parameters are:

-Right

This is either RELAY, SMTP or POP. Returns either the IP objects for RELAY, SMTP or POP connect rights.

-Mode

Optional. The relay and connect rights both have a mode which determines whether they are currently working on a default of all IPs granted the right, or IPs are denied the right. By default the list will be returned as the one that is in effect. Passing the mode will list the IPs that are specific for the mode you select. So using 0 with RELAY will show all the IPs that are allowed to relay when no connections can relay without authentication. Using 1 with RELAY will show all the IPs that need to authenticate when all connections don't need to authenticate. Remember that only one of these modes are enabled at any time. Either all IPs are permitted to relay without authentication, or all IPs must authenticate.

Example:

```
Get-MailEnableAccess -Right "POP" -Mode 0
```

### Set-MailEnableAccess

You can set whether you are denying all IPs relay or connection rights by default or allowing. For relay rights this corresponds to the option "All connections can send email without authentication" and "All connections must authenticate to send outbound email. It is recommended to leave relay rights as mode 0, otherwise any IP address can relay without authentication.

-Right

This is either RELAY, SMTP or POP. Whether you want to set the option for SMTP RELAY rights or POP and SMTP CONNECT rights.

-Mode

For relaying right, 0 is for requiring all connections to authentication and 1 is for all connections can relay without authenticating. For POP/SMTP connection rights, this is 0 for denying all IPs connections and 1 for allowing all IPs to connect.

Example:

```
Set-MailEnableAccess -Right RELAY -Mode 0
```

### Add-MailEnableAccess

This adds an IP address with the specified right.

-IP

The IP address or IP mask to add. Masks must use \* as wildcard.

-Right

Needs to be either RELAY, SMTP or POP, depending on whether the IP address is being added for relay control or connect control.

-Mode

Optional. If missing it adds the IP to the currently selected mode.

Example:

```
Add-MailEnableAccess -IP "127.0.0.1" -Right RELAY -Mode 0
```

### **Remove-MailEnableAccess**

-IP

The IP address or IP mask to remove. It needs to be an exact match.

-Right

Needs to be either RELAY, SMTP or POP. Determines the right you are removing for the IP.

-Mode

Optional. If missing it removes the IP from the currently selected mode. 0 is used for granting the right or 1 is for denying the right.

Example:

```
Remove-MailEnableAccess -IP "127.0.0.1"
```

### **Get-MailboxFolderPermission**

This returns a list of the folder permissions for a mailbox folder.

-Identity

This is the folder you want to display permissions for. It is formatted as:

```
Mailbox:\folder
```

Where mailbox is the mailbox you are displaying details for. Mailbox can be formatted as [SF:postoffice/mailbox] or it can be an email address. If it is an email address, it will look up the mailbox from the address as an extra step.

\folder is the folder you are wanting to display permissions for. This can be a mail, contact, or calendar folder. An example of retrieving the sharing of a complete mailbox to another can be done with one of the following commands:

```
Get-MailboxFolderPermission -Identity [SF:postoffice/mailbox]:\
```

```
Get-MailboxFolderPermission -Identity john@example.com:\
```

If the inbox being shared, the permissions can be checked with:

```
Get-MailboxFolderPermission -Identity john@example.com:\Inbox
```

### **Add-MailboxPermission**

Shares a mailbox folder to another user and also connects it to the mailbox, so that it is displayed in the users folder list. If you don't want the recipient to have the shared item automatically appear in their email client, then you use the -OnlyShare parameter. The sharing recipient would then need to add this folder if they wish. For ANONYMOUS and EVERYONE sharing, the OnlyShare parameter is ignored.

When sharing a folder, be aware that all subfolders are available to who the item is being shared to. So if you share the mailbox, all folders in that mailbox will be available to the share recipient.

#### -AccessRights

Only FullAccess and ReadItems are supported access rights.

#### -OnlyShare

This option shares the folder, but does not automatically add it to the share recipients folder list. They would need to connect to the share if they want to see it in their mail client.

#### -Identity

This is the folder you want to add permissions for. It is formatted as:

Mailbox:\folder

Where mailbox is the mailbox you are displaying details for. Mailbox can be formatted as [SF:postoffice/mailbox] or it can be an email address. If it is an email address, it will look up the mailbox from the address as an extra step. \folder is the folder you are wanting to add permissions for. This can be a mail, contact, or calendar folder.

#### -User

This is the mailbox that is being shared to. It must be in the same postoffice. To share to everyone, which allows access to all mailboxes in the postoffice, use {\$EVERYONE} as the mailbox name. To share the path to anyone, which means to users that do not authenticate, use {\$ANONYMOUS} as the mailbox name.

An example of adding a share, where Johns Inbox will be shared with full access to Bob:

```
Add-MailboxFolderPermission -Identity john@example.com:\Inbox -User bob -AccessRight FullAccess
```

## PowerShell Command Line Examples

The following examples show some of the more common commands you may wish to execute via PowerShell.

Before executing the commands, you should ensure that the extension is loaded using the following PowerShell command: Add-PSSnapin MailEnable.Provision.Command

### Platform Examples

# Get the current IMAP alternate port number

```
Get-MailEnablePlatform -Setting imapAlternatePort
```

# Set the current IMAP alternate port number

```
Set-MailEnablePlatform -Setting imapAlternatePort -Value 993
```

### Postoffice Examples

# Create a new Postoffice with domain

```
New-MailEnablePostoffice -Domain "example.com" -Postoffice "example.com"
```

# Create a new Postoffice, domain and mailbox as ADMIN user

```
New-MailEnablePostoffice -Domain "example.com" -Postoffice "example.com" -AdminUserName "adminuser" -AdminPassword "pwd1234"
```

# Create a new Postoffice, domain and mailbox as ADMIN user, and mailbox as USER user

```
New-MailEnablePostoffice -Domain "example.com" -Postoffice "example.com" -AdminUserName "adminuser" -AdminPassword "pwd1234" -UserName "sales" -Password "pwd1234"
```

# Create a new Postoffice, domain and multiple mailboxes

```
New-MailEnablePostoffice -Domain "example.com" -Postoffice "example.com" -UserName "sales,support,accounts,marketing" -Password "pwd1234,pwd4321,pwd6789,pwd3456"
```

# Disable a Postoffice

```
Set-MailEnablePostoffice -Postoffice "example.com" -Setting poEnabled -Value 0
```

# Enable ActiveSync for a Postoffice

```
Set-MailEnablePostoffice -Postoffice "example.com" -Setting poActiveSync -Value 1
```

# Get the state of ActiveSync for a Postoffice

```
Get-MailEnablePostoffice -Postoffice "example.com" -Setting poActiveSync
```

### Mailbox Examples

# Create a new mailbox for a Postoffice/domain

```
New-MailEnableMailbox -Mailbox "Joe" -Domain "example.com" -Password "password" -Right "USER"
```

# Change user password

```
Set-MailEnableMailbox -Postoffice "example.com" -Mailbox "Joe" -Setting "mailboxPassword" -Value "blah123"
```

# Change user display name

```
Set-MailEnableMailbox -Postoffice "example.com" -Mailbox "Joe" -Setting "mailboxDisplayName" -Value "mydisplayname"
```

# Change user timezone

```
Set-MailEnableMailbox -Postoffice "example.com" -Mailbox "Joe" -Setting "mailboxTimeZone" -Value "Mountain Standard Time"
```

# Set a user's mailbox quota to 50MB

```
Set-MailEnableMailbox -Postoffice MailEnable -Mailbox Andrew -Setting mailboxLimit -Value 50000
```

# Set a user's mailbox quota to unlimited

```
Set-MailEnableMailbox -Postoffice MailEnable -Mailbox Andrew -Setting mailboxLimit -Value "-1"
```

# Disable login access to a mailbox

```
Set-MailEnableMailbox -Postoffice MailEnable -Mailbox Andrew -Setting mailboxLoginStatus -Value 0
```

# Disable a mailbox (prevents message delivery to a mailbox)

```
Set-MailEnableMailbox -Postoffice MailEnable -Mailbox Andrew -Setting mailboxStatus -Value 0
```

## Domain Examples

# List the domains for the platform

```
Get-MailEnableDomain
```

# Redirect domain to another host

```
Set-MailEnableDomain -Domain "example32.com" -Setting "domainRedirectionHosts" -Value  
"test.example.com,test2.example.com"
```

```
Set-MailEnableDomain -Domain "example32.com" -Setting "domainRedirectionStatus" -Value "1"
```

# Disable domain redirection

```
Set-MailEnableDomain -Domain "example32.com" -Setting "domainRedirectionStatus" -Value "0"
```

# List domains

```
Get-MailEnableDomain -Domain "example32.com"
```

# Get properties of a domain object

```
Get-MailEnableDomain -Domain "example32.com"
```

# Get a setting for a domain

```
Get-MailEnableDomain -Domain "example32.com" -Setting "domainRedirectionStatus"
```

# List the domains for a given Postoffice

```
Get-MailEnableDomain -Postoffice "example.com"
```

## Mail Distribution Group Examples

# Create a new group

```
New-MailEnableGroup -Postoffice "example.com" -GroupName "myGroup222" -EmailAddress  
"mygroup@example.com"
```

# Remove a group

```
Remove-MailEnableGroup -Postoffice "example.com" -GroupName "myGroup222"
```

# Add a member to a group

```
New-MailEnableGroupMember -Postoffice "example.com" -GroupName "myGroup222" -EmailAddress  
"member@example.com"
```

# Remove a member from a group

```
Remove-MailEnableGroupMember -Postoffice "example.com" -GroupName "myGroup222" -EmailAddress  
"member@example.com"
```

# List the members of a group

```
Get-MailEnableGroupMember -Postoffice "example.com" -GroupName "myGroup222"
```

## Mail Distribution List Examples

# Create a Distribution List

```
New-MailEnableList -Postoffice "example.com" -ListName "myList222" -EmailAddress "mylist@example.com" -  
Description "my example list"
```

# Remove list

```
Remove-MailEnableList -Postoffice "example.com" -ListName "myList222"
```

# Add a member to a list

```
New-MailEnableListMember -Postoffice "example.com" -ListName "myList222" -EmailAddress  
"member@example.com"
```

# Remove a member from a list

```
Remove-MailEnableListMember -Postoffice "example.com" -ListName "myList222" -EmailAddress  
"member@example.com"
```

# List the members of a list

```
Get-MailEnableListMember -Postoffice "example.com" -ListName "myList222"
```

## Mail Address Examples

# Add a mapping to an SMTP address to a local mailbox

```
New-MailEnableAddressMap -EmailAddress "Email@example.com" -Postoffice "example.com" -Mailbox "Joe"
```

# Remove a mapping to an SMTP address to a local mailbox

```
Remove-MailEnableAddressMap -EmailAddress "Email@example.com" -Postoffice "example.com" -Mailbox "Joe"
```

# Get the Email addresses associated with a mailbox

```
Get-MailEnableAddressMap -Postoffice "example.com" -Mailbox "Joe"
```

## PowerShell Script Example

The following example shows how you can perform batch operations within PowerShell scripts.

The example below shows how you can iterate all the postoffices within MailEnable and enable public folder support. You can use the PowerShell ISE to develop your PowerShell scripts.

```
#####  
# Example script: Enable Public Folders for all Postoffices  
#####  
# Ensure the snapin module is loaded (if it is not already)  
if ((Get-PSSnapin -Name MailEnable.Provision.Command -ErrorAction SilentlyContinue) -eq $null )  
{  
    Add-PsSnapin MailEnable.Provision.Command  
}  
# Get the list of PostOffices  
$lstPostoffices = Get-MailEnablePostoffice  
  
ForEach($oPostoffice in $lstPostoffices)  
{  
    # Set the Public Folder Status Flag for each Postoffice  
    Set-MailEnablePostoffice -Postoffice $oPostoffice.Name -Setting "poPublicFolders" -Value 1  
}
```

A similar script can also be used to change settings on all mailboxes in a postoffice. The following script disables webmail for all mailboxes in a postoffice. Although the postoffice setting is checked first, this may be useful if you need to disable a feature for all mailboxes and enable ones on a case-by-case basis.

```
# Ensure the snapin module is loaded (if it is not already)  
if ((Get-PSSnapin -Name MailEnable.Provision.Command -ErrorAction SilentlyContinue) -eq $null)  
{  
    Add-PSSnapin MailEnable.Provision.Command  
}  
  
# Get the list of mailboxes in the postoffice  
$lstMailboxes = Get-MailEnableMailbox -Postoffice "example.com"  
  
ForEach($oMailbox in $lstMailboxes)  
{  
    # Set the webmail setting  
    Set-MailEnableMailbox -Postoffice "example.com" -Mailbox $oMailbox.MailboxName -Setting  
"mailboxWebMail" -Value 0  
}
```

## More Information

For more information on configuring MailEnable via PowerShell and integrating with other cmdlets, please refer to the Microsoft PowerShell reference.

## Custom Options

It is possible to allow custom options to be stored as mailbox values using PowerShell. This is disabled on installation, but you can add the following registry key to add this:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Mail Enable\Mail Enable\Provision]
"Custom options"=dword:00000001
```

Once you add this, then you can use custom setting names to store values against the mailbox. In the example below we are setting a option called ObjectGUID which is not a preset option:

```
Set-MailEnableMailbox -Postoffice "example.com" -Mailbox "testuser" -Setting "ObjectGUID" -Value "123456"
```

```
Get-MailEnableMailbox -Postoffice "example.com" -Mailbox "testuser" -Setting "ObjectGUID"
```

## Settings

A complete list of the available settings is below.

SettingId : imapListenPort  
SettingType : MailEnablePlatform  
SettingDataType : dword  
SettingControl : dword  
Purpose : The port the IMAP service will listen on.

SettingId : imapListenPortSSLEnabled  
SettingType : MailEnablePlatform  
SettingDataType : dword  
SettingControl : 0=Disabled, 1=Enabled  
Purpose : Whether the IMAP listening port is using SSL.

SettingId : imapAlternatePortEnabled  
SettingType : MailEnablePlatform  
SettingDataType : dword  
SettingControl : 0=Disabled, 1=Enabled  
Purpose : Whether the IMAP service is listening on another port.

SettingId : imapAlternatePort  
SettingType : MailEnablePlatform  
SettingDataType : dword  
SettingControl : dword  
Purpose : The alternate port the IMAP service will listen on.

SettingId : imapAlternatePortSSLEnabled  
SettingType : MailEnablePlatform  
SettingDataType : dword  
SettingControl : 0=Disabled, 1=Enabled  
Purpose : Whether the alternate IMAP listening port is using SSL.

SettingId : imapExtensions  
SettingType : MailEnablePlatform  
SettingDataType : string  
SettingControl : checklist  
Purpose :
