## Lesson 12: Systems of Inequalities Word Problems

## Example 1

The girls' swim team is hosting a fund raiser. They would like to raise at least $\$ 500$. They are selling candles for $\$ 5$ and flower arrangements for $\$ 6$. The girls estimate that at most they will sell 200 items.

- Write a system of inequalities to represent this situation.
- Graph each inequality on the grid.
- 120 candles have been sold. Use your graph to determine a reasonable number of flower arrangements that must be sold in order for the girls to reach their goal of at least $\$ 500$. Justify your answer.

|  |  |  |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |

## Lesson 12: Systems of Inequalities Word Problems

1. The ninth graders are hosting the next school dance. They would like to make at least a $\$ 500$ profit from selling tickets. The ninth graders estimate that at most 300 students will attend the dance. They will earn $\$ 3$ for each ticket purchased in advance and $\$ 4$ for each ticket purchased at the door.

- Write a system of inequalities to represent this situation.
- Graph each inequality on the grid.
- Suppose only 30 people buy advance tickets. How many people would need to buy tickets at the door? (Identify one realistic solution). Justify your answer.

2. In order to prepare for your summer bash, you go to the supermarket to buy hamburgers and chicken. Hamburgers cost $\$ 2$ per pound and chicken costs $\$ 3$ per pound. You have no more than $\$ 30$ to spend. You expect to purchase at least 3 pounds of hamburgers.

- Write a system of inequalities to represent this situation.
- Graph the system of inequalities on the grid.
- Give three possible combinations for buying hamburgers and chicken for your summer bash.
- Justify your answers.

3. Jenny is making jewelry for an Arts and Crafts show. She would like to make at least $\$ 100$ in sales. She estimates that she will sell at most 50 pieces of jewelry. The bracelets that she is selling cost $\$ 2$ and the necklaces cost $\$ 3$.

- Write a system of inequalities to represent this situation.
- Graph each inequality on the grid below.
- Give two possible combinations of bracelets and necklaces that can be sold in order for Jenny to meet her goal. Justify your answer.

4. Jason is buying wings and hot dogs for a party. One package of wings costs $\$ 7$. Hot dogs cost $\$ 5$ per package. He must spend no more than $\$ 40$.

- Write an inequality to represent the cost of Jason's food for the party.
- Jason knows that he will be buying at least 5 packages of hot dogs. Write an inequality to represent this situation.
- Graph both inequalities. Give two options for Jason when buying wings and hot dogs.

A Dinner Theatre actress is paid $\$ 250$ per day to rehearse the play and $\$ 500$ per day to perform in front of an audience. In one season, an actress earned between $\$ 2000$ and $\$ 5000$.

- Write a system of inequalities that represents this situation. (2 points)
- Graph the system of inequalities on the grid. (2 points)
- Identify two different ways the actress may have earned her salary. Justify your answers. (2 points)

## Lesson 12: Systems of Inequalities Word Problems (Answer Key)

1. The ninth graders are hosting the next school dance. They would like to make at least a $\$ 500$ profit from selling tickets. The ninth graders estimate that at most 300 students will attend the dance. They will earn $\$ 3$ for each ticket purchased in advance and $\$ 4$ for each ticket purchased at the door.

- Write a system of inequalities to represent this situation.
- Graph each inequality on the grid.
- Suppose only 30 people buy advance tickets. How many people would need to buy tickets at the door? (Identify one realistic solution) Justify your answer.

## What do we know:

Make at least \$500
At most 300 students will attend \$3 for advance \& \$4 for tickets at door

We must write two inequalities. We know information about the cost of tickets and the number of expected attendees.

Let $\mathrm{x}=$ the number of people who purchase tickets in advance Let $y=$ the number of people who purchase tickets at the door

## Verbal model for cost of tickets:

Advance purchase + Door purchase is at least $\$ 500$
$3 x+4 y \geq 500$
$3 x+4 y \geq 500$

## Verbal model for number of expected attendees

At most 300 students will attend
$x+y \leq 300$ (The number of students total is the number of advance purchasers + the number of door purchasers $(x+y)$ $\mathbf{x + y} \leq 300$

- Our system of inequalities for this situation is:

$$
3 x+4 y \geq 500 \quad \& \quad x+y \leq 300
$$

The red line represents:
The blue line represents:
$3 x+4 y \geq 500$
The x -intercept (let $\mathrm{y}=0$ )
$3 x+4(0)=500$
$3 x=500$
$\mathrm{x}=166.67$

The $y$-intercept (let $x=0$ )
$3(0)+4 y=500$
$4 y=500$
$\mathrm{Y}=125$

Shading: Substitute (0,0)
$3 x+4 y \geq 500$
$3(0)+4(0) \geq 500$
$0 \geq 500$ is not true

$$
x+y \leq 300
$$

The x -intercept (let $\mathrm{y}=0$ )
$x+0=300$
$\mathbf{x}=\mathbf{3 0 0}$

The $y$-intercept (let $x=0$ )
$0+y=300$
$\mathrm{y}=300$

Shading: Substitute (0,0)
$x+y \leq 300$
$0+0 \leq 300$
$0 \leq 300$ is true

Solution Area (nurnle reaion)

According to the graph, if 30 people buy advance tickets, then about 120 would need to buy tickets at the door in order for the $9^{\text {th }}$ graders to make their goal of at least \$500.

Justify:
$3 x+4 y \geq 500$
$3(30)+4(120) \geq 500$
$90+480 \geq 500$
$150 \leq 300$
2. In order to prepare for your summer bash, you go to the supermarket to buy hamburgers and chicken. Hamburgers cost $\$ 2$ per pound and chicken costs $\$ 3$ per pound. You have no more than $\$ 30$ to spend. You expect to purchase at least 3 pounds of hamburgers.

- Write a system of inequalities to represent this situation.
- Graph the system of inequalities on the grid.
- Give three possible combinations for buying hamburgers and chicken for your summer bash.
- Justify your answers.

## What do we know:

## Hamburgers -\$2

Chicken - \$3
No more than $\$ \mathbf{3 0}$ to spend
Purchase at least $\mathbf{3}$ pounds of hamburger
We must write two inequalities. We know information about the cost of hamburgers and chicken and about how much hamburger you will purchase.

Let $x=$ the number of pounds of hamburger
Let $y=$ the number of pounds of chicken
Verbal Model:

| Cost of hamburger | + | Cost of chicken |
| :--- | :--- | :--- |
| $2 x$ | is no more than $\$ 30$ |  |
| $2 x+3 y \leq 30$ |  |  |

Purchase at least 3 pounds of hamburgers
$x \geq 3$ (hamburgers are greater than or equal to 3 pounds)

- Our system of inequalities for this situation is:

$$
2 x+3 y \leq 30 \quad \& \quad x \geq 3
$$

Let the red line represent:
$2 x+3 y \leq 30$
$X$ intercept: (let $y=0$ )
$2 x+3(0)=30$
$2 x=30$
$X=15$

Y intercept (let $\mathrm{x}=0$ )
$2(0)+3 y=30$
$3 y=30$
$Y=10$
Shading; Substitute (0,0)
$2(0)+3(0) \leq 30$
$0 \leq 30$ is true
(shade the half plane that
contains ( 0,0 )).

Let the blue line represent:

$$
x \geq 3
$$

$x=3-$ this is a vertical line through the x intercept: $\mathrm{x}=3$.

Three possible combinations for buying hamburgers and chicken are:

- 3 pounds of hamburger and 7 pounds of chicken.
Justify: $2(3)+3(7) \leq 30 \quad \& \quad x \geq 3$
$27 \leq 30 \odot \quad 3 \geq 3 \odot$
- 6 pounds of hamburger and 6 pounds of chicken.
Justify: $2(6)+3(6) \leq 30 \quad \& \quad x \geq 3$

$$
30 \leq 30 \odot \quad 6 \geq 3 \odot
$$

- 10 pounds of hamburger and 3 pounds of chicken.
Justify: $2(10)+3(3) \leq 30 \quad \& \quad x \geq 3$
$29 \leq 30 \odot \quad 10 \geq 3 \odot$

Answers will vary. Any ordered pair within the purple shaded region is correct.
3. Jenny is making jewelry for an Arts and Crafts show. She would like to make at least $\$ 100$ in sales. She estimates that she will sell at most 50 pieces of jewelry. The bracelets that she is selling cost $\$ 2$ and the necklaces cost $\$ 3$.

- Write a system of inequalities to represent this situation.
- Graph each inequality on the grid below.
- Give two possible combinations of bracelets and necklaces that can be sold in order for Jenny to meet her goal. Justify your answer.

## What do we know:

Bracelets - $\mathbf{\$ 2} \quad$ Necklaces - \$3 Make at least \$100
Will sell at most 50 pieces of jewelry
We must write two inequalities. We know information about the sales of bracelets and necklaces and how many pieces of jewelry she will sell.
Let $\mathrm{x}=$ the number of bracelets
Let $y=$ the number of necklaces

## Verbal Model:

Bracelet Sales + Necklace sales is at least \$100
$2 x \quad+3 y \quad \geq 100$
$2 x+3 y \geq 100$
Sell at most 50 pieces of jewelry
Bracelets + necklaces $\leq 50$
$x+y \leq 50$

- Our system of inequalities for this situation is: $2 x+3 y \geq 100 \quad \& \quad x+y \leq 50$

Let the red line represent:
$2 x+3 y \geq 100$
Let the blue line represent:
$x+y \leq 50$
$X$ intercept: (let $y=0$ )
$2 x+3(0)=100$
$2 x=100$
X = 50

Y intercept (let $\mathrm{x}=0$ )
$2(0)+3 y=100$
$3 y=100$
$\mathbf{Y}=33.3$
Shading; Substitute (0,0)
$2(0)+3(0) \geq 100$
$0 \geq 100$ not true
(shade the half plane that does not contain $(0,0)$ ).
$X$ intercept (let $y=0$ )
$x+0=50$
$\mathrm{x}=50$
$Y$ Intercept (let $x=0$ )
$0+y=50$
$\mathrm{y}=50$

Shading: Substitute (0,0)

$$
0+0 \leq 50
$$

$0 \leq 50$ is true, so shade
the half plane that
contains $(0,0)$

Bracelet and Necklace Sales

Two possible combinations of bracelet and necklace sales are:

- 20 bracelets and 25 necklaces.

$$
\text { Justify: } 2(20)+3(25) \geq 100 \& 20+25 \leq 50
$$

$$
115 \geq 100 \odot \quad \& \quad 45 \leq 50 \odot
$$

- 30 bracelets and 15 necklaces.

$$
\begin{array}{ccc}
\text { Justify: } 2(30)+3(15) \geq 100 & \& & 30+15 \leq 50 \\
105 \geq 100 ~ \odot & 45 \leq 50 \odot
\end{array}
$$

Answers will vary. Any ordered pair within the purple shaded region is correct.
4. Jason is buying wings and hot dogs for a party. One package of wings costs $\$ 7$. Hot dogs cost $\$ 5$ per package. He must spend no more than $\$ 40$.

- Write an inequality to represent the cost of Jason's food for the party.
- Jason knows that he will be buying at least 5 packages of hot dogs. Write an inequality to represent this situation.
- Graph both inequalities. Give two options for Jason when buying wings and hot dogs.

## What do we know:

## Wings -\$7 <br> Hot Dogs - \$5 <br> Spend no more than \$40

Buy at least 5 packages of hot dogs
We must write two inequalities. We know information about the price of wings and hot dogs and how many packages of hot dogs he will buy.
Let $x=$ the number of packages of wings
Let $y=$ the number of packages of hot dogs
Verbal Model: (cost of Jason's Food)
Wings + Hot dogs must cost no more than $\$ 40$
$7 x+5 y \leq 40$
$7 x+5 y \leq 40$
Verbal Model: (hot dog packages)
At least 5 packages of hot dogs
$\mathrm{Y} \geq 5$ (hot dogs are greater than or equal to 5)

- Our system of inequalities for this situation is:

$$
7 x+5 y \leq 40 \quad \& \quad y \geq 5
$$

Let the red line represent:
$7 x+5 y \leq 40$
$X$ intercept: (let $y=0)$
$7 x+5(0)=40$
$7 x=40$
$X=5.71$
$\mathbf{Y}$ intercept (let $\mathbf{x}=0$ )
$7(0)+5 y=40$

$$
Y=8
$$

Shading; Substitute (0,0)
$7(0)+5(0) \leq 40$
$0 \leq 40$ is true
(shade the half plane that contains ( 0,0 )).

Jason doesn't have a whole lot of options for buying wings and hot dogs. Notice that the purple shaded region is very small.

Two options for buying wings and hot dogs are:
$(1,5) 1$ package of wings and 5 packages of hot dogs.

| $7(1)+5(5) \leq 40$ | $y \geq 5$ |
| :--- | :--- |
| $32 \leq 40 \bigodot$ | $5 \geq 5$ |
| $\bigodot$ | $\because$ |

$(2,5) 2$ packages of wings and 5 packages of hot dogs.
$7(2)+5(5) \leq 40$
$y \geq 5$
$39 \leq 40 \because$
$5 \geq 5$ (-)

## Check Your Understanding

A Dinner Theatre actress is paid $\$ 250$ per day to rehearse the play and $\$ 500$ per day to perform in front of an audience. In one season, an actress earned between $\$ 2000$ and $\$ 5000$.

- Write a system of inequalities that represents this situation. (2 points)

## Let $x=$ the number of days the actress rehearses <br> Let $\mathrm{y}=$ the number of days the actress performs

We know that she earned between 2000 and 5000. This means greater than 2000 and less than 5000. So, we will write two equations based on this information.
$250 x+500 y>2000$
$250 x+500 y<5000$
This is our system of equations.

- Graph the system of inequalities on the grid. (2 points)

In order to graph, we will first find the xintercepts of both equations because we must determine the scale that will be used on the $x$ and $y$ axis.
$250 x+500 y>2000 \quad$ (Red Line)
x-int: $(8,0) \quad Y$ int: $(0,4)$
$250 x+500 y<5000 \quad$ (Blue Line)
x-int: $(20,0) \quad Y$ int: $(0,10)$
Largest x coordinate is 20 , so I will use a scale of 2 on the $x$ axis.

Largest y coordinate is 10 , so I will use a scale of 1 on the $y$ axis.

The red line's solution set does not contain $(0,0)$ because $0>2000$ is not a true statement.

The blue line's solution set contains $(0,0)$ because $0<5000$ is a true statement.

The solution set for the system is between the red and blue lines as this is the part that was shaded by both graphs.

- Identify two different ways the actress may have earned her salary. Justify your answers. (2 points)

The actress may have earned her salary by rehearsing for 6 days and performing for 6 days. $(6,6)$ Justification:

| $250 x+500 y>2000$ | $250 x+500 y<5000$ |
| :---: | :---: |
| $250(6)+500(6)>2000$ | $250(6)+500(6)<5000$ |
| $4500>2000$ | $4500<5000$ |

The actress may have rehearsed for 10 days and performed for 4 days. $(10,4)$

| $250 x+500 y>2000$ | $250 x+500 y<5000$ |
| :---: | :---: |
| $250(4)+500(4)>2000$ | $250(4)+500(4)<5000$ |
| $3000>2000$ | $3000<5000$ |
