# MODEL LIFE TABLES FOR DEVELOPING COUNTRIES

#### **NOTE**

Symbols of United Nations documents are composed of capital letters combined with figures. Mention of such a symbol indicates a reference to a United Nations document.

The designations employed and the presentation of the material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

The term "country" as used in the text of this report also refers, as appropriate, to territories or areas.

The printing of this publication was made possible by a grant from the United Nations Fund for Population Activities

Sales No. E.81.XIII.7

#### **PREFACE**

This study, carried out by the Population Division of the Department of International Economic and Social Affairs of the United Nations Secretariat, presents new model life tables for developing countries. The pioneering effort in the development of model life tables was carried out by the United Nations a quarter of a century ago and resulted in the publication of Age and Sex Patterns of Mortality: Model Life Tables for Under-developed Countries.\* Approximately a decade later, in 1966, Ansley Coale and Paul Demeny at Princeton University published a new set of model life tables\*\* based mainly on historical European experience. Those tables have become the most commonly used set of model life tables within the demographic community. Recent evidence indicates that age patterns of mortality in many developing countries differ systematically from those of historical European experience, and the Coale and Demeny tables are therefore not fully suitable to demographic research in developing countries.

The present study gives new sets of age-sex patterns of mortality which are based on reliably documented developing country data and hence may be more applicable to demographic analysis within the developing regions. Future publications related to the model life table project, being prepared by the Population Division, will include studies on stable populations, estimated unabridged life tables, and computer programs to facilitate use of the tables.

Acknowledgement is due to Mr. Hervé Le Bras of the Institut national d'études démographiques, consultant to the Population Division for methodological considerations, and to the Organisation for Economic Co-operation and Development for their collaboration in providing an extensive collection of mortality and population data which was a major data source for this project.

Acknowledgement is also due to the United Nations Fund for Population Activities whose grant made the printing of this publication possible (GLO/78/PO9).

<sup>\*</sup>United Nations publication, Sales No. E.55.XIII.9.

<sup>\*\*</sup>A. J. Coale and P. Demeny, Regional Model Life Tables and Stable Populations (Princeton, N.J., Princeton University Press, 1966).

<sup>&</sup>lt;sup>†</sup>A report was issued in 1979 outlining the rationale for new model life tables and a work plan for their preparation. See *Model Life Tables for Developing Countries: an interim report* prepared by the Population Division, Department of International Economic and Social Affairs of the United Nations Secretariat, January 1979 (ESA/P/WP.63).

### **Explanatory notes**

The following symbols have been used in the tables throughout the report:

A blank in a table indicates that the item is not applicable

A minus sign (-) indicates a deficit or decrease, except as indicated.

A full stop (.) is used to indicate decimals

Use of a hyphen (-) between dates representing years, e.g., 1971-1973, signifies the full period involved, including the beginning and end years.

Details and percentages in tables do not necessarily add to totals, because of rounding.
