Non-Obstructive Coronary Artery Disease in Women

Puja K. Mehta, MD FACC FAHA
Director, Women's Translational Cardiovascular Research
Assistant Professor, Emory Women's Heart Center
Emory Clinical Cardiovascular Research Institute (ECCRI)
February 16, 2019

EMORY WOMEN'S HEART CENTER

Disclosures

- None

Magnitude of the Problem

- Cardiovascular disease is a leading cause of morbidity and mortality in women, regardless of race or ethnicity.
  - The leading cause of death - ischemic heart disease and stroke
- 2 out of 3 women who have a heart attack never fully recover.
- Among women who survive an attack, 46% are disabled with heart failure within 6 years.

Mosca L et al. *Circulation* 2011;123

Ischemic Heart Disease in Women

- Younger women --
  - Higher mortality after MI than men
  - Lower decline in IHD mortality
  - MI incidence increasing
  - Unexplained by traditional risk factors
  - Less obstructive CAD on angiography --- MINOCA (10-15% of ACS, 1-year prognosis is ~5% for all cause mortality)
- Each year in US:
  - >10,000 MIs in women < 45 years
  - >100,000 MIs in women <65 years

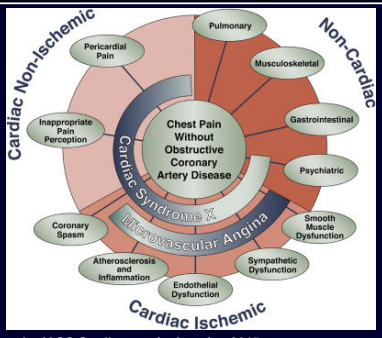
IHD Risk Factors in Women

Traditional Risk Factors	Emerging Risk Factors
✓Age	✓Ethnicity
✓Hypertension	Adverse Pregnancy Outcomes
✓Dyslipidemia	Autoimmune diseases
✓Diabetes	Premature Menopause
Obesity	Radiation/Chemotherapy
✓Smoking	Obstructive Sleep Apnea
Family History	Depression
Physical Inactivity	Psychosocial factors
	Environmental

Chest Pain without Obstructive CAD



Marinescu MA et al. *JACC Cardiovascular Imaging 2015.*

Ischemia and No Obstructive Coronary Arteries (INOCA): Major Clinical Problem

- Patient presents with Angina (typical or atypical)
  - Chest pain/pressure, dyspnea, dizziness, left arm or jaw pain, nausea, weakness, unusual fatigue, etc
- Evidence of myocardial ischemia
  - EKG changes and/or troponin positive
  - Abnormal cardiac stress testing
- Cardiac catheterization - (anatomy)
  - Open arteries
  - No obstructive coronary artery disease (<50% stenosis)

Ischemia and No Obstructive CAD (INOCA)

- ~ 2/3 of women suspected of ischemia have no obstructive CAD on angiography.
- INOCA is not benign - death, MI, stroke, and HF hospitalizations.
- ~ 50% with INOCA have coronary microvascular dysfunction (CMD). ~3 million U.S. women
- No clear clinical practice management guidelines
- High healthcare utilization/costs – repeat cardiac stress testing and repeat angiograms
- Disability, poor satisfaction and quality of life
- Psychosocial risk factors – depression, anxiety

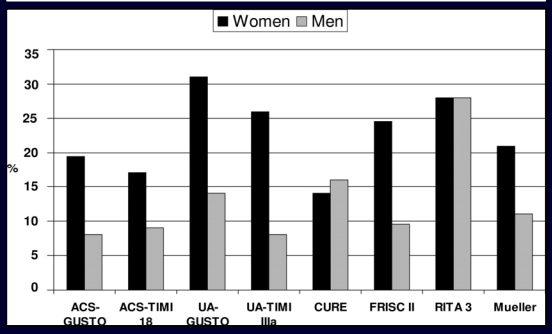
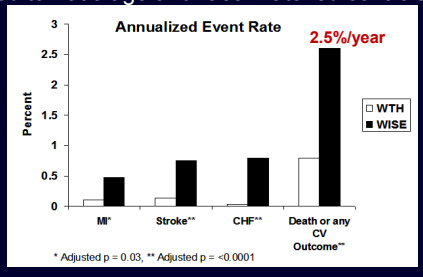
Prevalence of No Obstructive CAD in Acute Coronary Syndrome Studies



Anderson et al. *Circulation* 2007;115:823-826

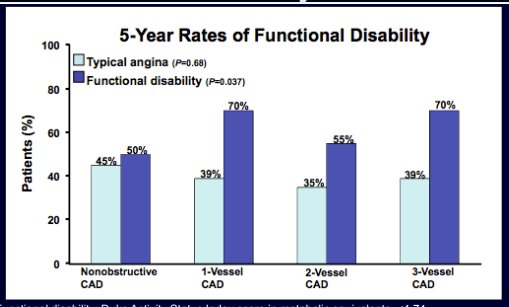
Prognosis of No Obstructive CAD

- N = 540 (WISE)
- Compared to 1000 age and race-matched controls (WTH)



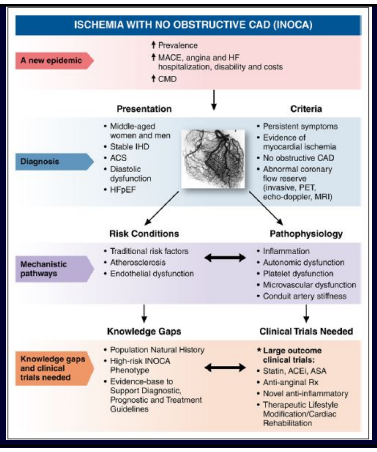
Gulati et al. *Arch Intern Med* 2009;169:843-850

WISE Study: Typical Angina and Functional Disability in Women



Functional disability: Duke Activity Status Index score in metabolic equivalents ≤4.74.
n=883 women presenting for evaluation of chest pain or other equivalent symptoms.
All women had ischemia at noninvasive testing.

Shaw LJ, et al. *Circulation*. 2006;114:894-904.



Bairey Merz et al. Circ 2017

Diagnostic Criteria of MINOCA

1. **Acute MI criteria, including:**
   a. Positive cardiac biomarker: defined as a rise and/or fall in serial levels, with at least 1 value above the 99th percentile upper reference limit.
   b. Clinical evidence of MI, including any of the following:
      i. Ischemic symptoms (chest pain and/or dyspnea)
      ii. Ischemic ECG changes (new ST segment changes or left bundle branch block)
      iii. New pathological Q waves
      iv. New loss of viable myocardium on myocardial perfusion imaging or
      v. New regional wall motion abnormality on left ventricular imaging.

2. **Non-obstructive coronary arteries on angiography**
Defined as the absence of obstructive coronary artery disease on angiography. (ie: no coronary artery stenosis ≥50%, in any potential infarct-related artery). This includes both patients with
   - normal coronary arteries (no stenosis >30%)
   - mild coronary atheromatosis (stenosis >30% but <50%)

3. **No clinically overt-specific cause for the acute presentation**
Defined at the time of angiography, the underlying cause of the clinical presentation and myocardial injury is not apparent

Beltrame JH Sept 2017

What is the Prevalence of MINOCA?

10-15% of Acute MI presentations

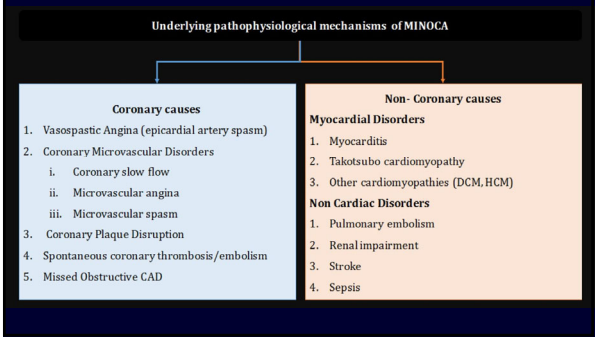
Which Population Predominates in MINOCA?

Women
Younger age

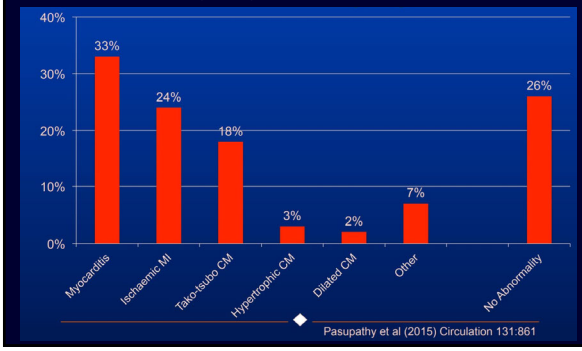
Prognosis of MINOCA

- Current estimates for 1 year after MINOCA
  - 5% of all cause mortality
  - 25% with recurrent angina

Pathophysiologic Mechanisms-MINOCA



Cardiac Magnetic Resonance Imaging in MINOCA



Typical Scenarios

1. Patients who self-refer or are referred by treating cardiologist after unexplained NSTEMI (no obstructive CAD on angiogram)

2. Recurrent rest, emotional stress-induced, or exertional angina

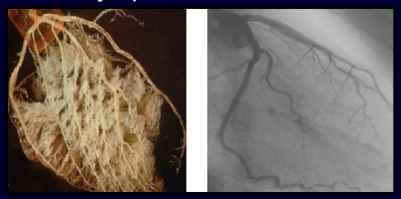
3. Several weeks post- PTCA and have "open" arteries who continue to have angina

4. Younger/peri-menopausal age range (45-55) who have signs and symptoms of ischemia

5. Women with risk factors such as h/o pre-eclampsia, chemotherapy, chest wall radiation, autoimmune disorders (i.e. lupus), migraines or Raynaud's

Coronary Microvascular Dysfunction (CMD)

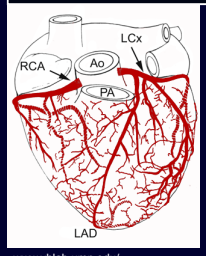
* Term used to describe abnormalities in regulation of myocardial blood flow not explained by epicardial atherosclerosis.



- CMD can be from endothelial dependent or independent mechanisms.

Camici et al. J Nucl Med 2010;50:1076-1087; Recio-Mayoral et a. EHJ 2009; 30: 1837.

Coronary Vascular Resistance

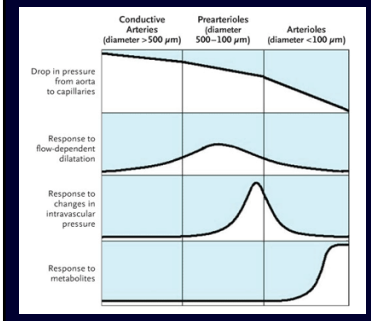


www.vhlab.umn.edu/

- Epicardial arteries normally contribute <10% of the coronary vascular resistance
- Coronary microvasculature is responsible for >70% of the coronary resistance under physiological circumstances.

Source: Gould KL et al. *Am J Cardiol.* 1974;33:87–94.
Camici P et al. *Heart, Lung, and Circ.* 2009;18:19-27

Functional Coronary Anatomy



- Epicardial and proximal arterioles – little resistance to flow; maintain a level of shear stress by endothelial-dep vasodilation.
- Pre-arterioles = extramyocardial, and thicker wall than arterioles – myogenic vasoconstriction to maintain flow (sympathetic control)
- Arterioles – high resting tone, dilate to metabolites

Source: Camici PG, and Crea F. *N Engl J Med.* 2007;356:830-40.

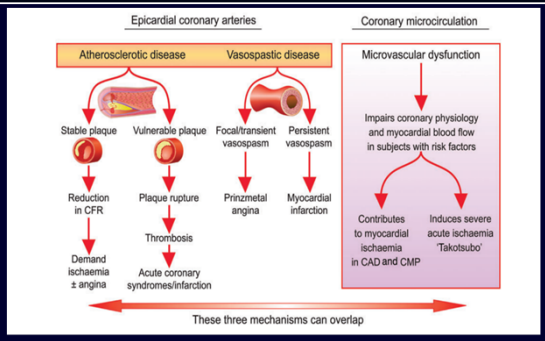
Mechanisms of Myocardial Ischemia



Crea et al. *EHJ* 2015

Gender Differences in Ischemic Heart Disease in Women

Structural Features (macro- and micro- vessels)	Functional Features (macro- and micro- vessels)
- Smaller size - Increased stiffness (fibrosis, remodeling, etc) - More diffuse disease - More plaque erosion versus rupture - Microemboli - Capillary rarefaction (drop out)	- Endothelial dysfunction - Smooth muscle dysfunction (Raynaud's, migraine, coronary artery spasm) - Inflammation - Vasculitis (Takayasu's arteritis, rheumatoid, SLE, giant cell, ete)

Shaw LJ, et al. *J Am Coll Cardiol.* 2009;54:1561-1575.

Pursue non-invasive stress testing for objective evidence of ischemia

- Is patient able to exercise?
- Is baseline EKG ok to pursue ETT (no LVH, LBBB, etc)?
- If yes, start with ETT:
  - Elicit symptoms
  - Detection of Ischemic EKG changes
  - METS and functional capacity
  - Arrhythmias
  - Hypertensive response to exercise

If ETT inconclusive and/or persistent symptoms

- Add an imaging test
  - Stress Echo (diastolic function, hypertrophy, pulmonary hypertension, valvular problems, WMA)
  - Stress PET-CT with Coronary Flow Reserve (added benefit of CAC)
  - Adenosine Stress Cardiac Magnetic Resonance Imaging (added benefit of scar imaging and best for tissue characterization)

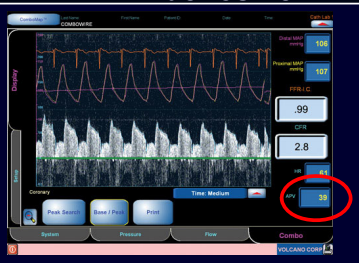
Negative Non-invasive Test Does Not Rule Out Coronary Vasoconstriction

Test	N	% (+)	Sensitivity (95% CI)	Specificity (95% CI)	NPV (95% CI)	PPV (95% CI)
Exercise Echocardiogram	99	40.4	38(26–51)	55(38–71)	36(24–49)	58(41–73)
Dobutamine Echocardiogram	21	33.3	29(8–58)	57(18–90)	29(8–58)	57(18–90)
Exercise SPECT	131	38.2	40(29–51)	65(49–78)	38(28–50)	66(51–79)
Vasodilator SPECT	64	50.0	51(35–68)	52(31–72)	41(24–59)	63(44–79)
Vasodilator PET	33	36.4	35(16–57)	60(26–88)	29(11–52)	67(35–90)
All imaging	365	41.4	41(34–47)	57(49–66)	36(30–43)	62(54–70)
Exercise ECG	242	16.1	18(12–25)	80(71–88)	41(33–48)	69(52–83)
All imaging + ECG	365	6.3	6(3–10)	90(83–94)	37(32–43)	61(39–80)

- No vasoconstrictive stimulus for clinical non-invasive testing (such as mental stress, cold pressor, hyperventilation, etc)

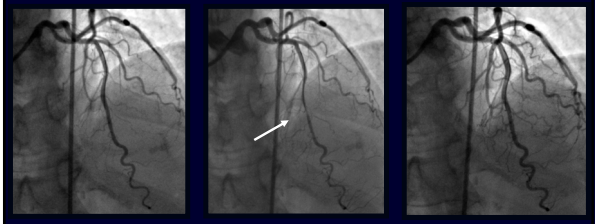
Cassar A et al. Circ Cardiovasc Interv. 2009;2(3): 237–244

Coronary Reactivity Testing: Adenosine



APV= Average Peak Velocity
CBF = Cross section area of coronary artery X APV/2

Macrovascular Coronary Function



Baseline | Acetylcholine | Nitroglycerin

CRT Safety Data: Out of 293 women, no CRT-related mortality.
0.7% serious adverse events: 1 had dissection, and 1 developed MI from coronary spasm.
MACE Rate at 5.4 year follow up: 8.2%

Source: Wei et al. JACC Interventions 2012;5(6):646

WISE Study Coronary Reactivity Testing Protocol

ADO	18 mcg	18 mcg	36 mcg
ACH	0.364 mcg	36.4 mcg	108 mcg
NTG	200 mcg		

Spasm Testing Dose

**Not done in the setting of ACS
**Higher ACH doses are used in other countries

Bairey Merz CN et al. Circulation. 2017;135(11):1075-1092

Components of Coronary Reactivity Testing

	Microvascular Dysfunction	Macrovascular Dysfunction
Non-Endothelial Dependent	CFR <2.5 to Adenosine	Coronary dilation <20% to Nitroglycerin
Endothelial Dependent	ΔCBF <50% to Acetylcholine	Coronary dilation ≤0% to Acetylcholine
Coronary Spasm	Chest pain + ECG changes + significant constriction to Acetylcholine

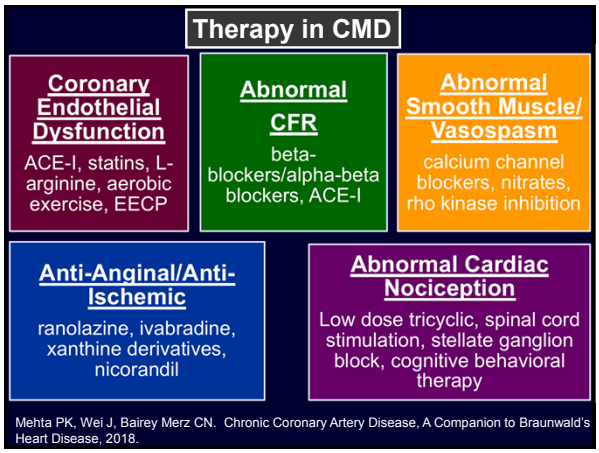
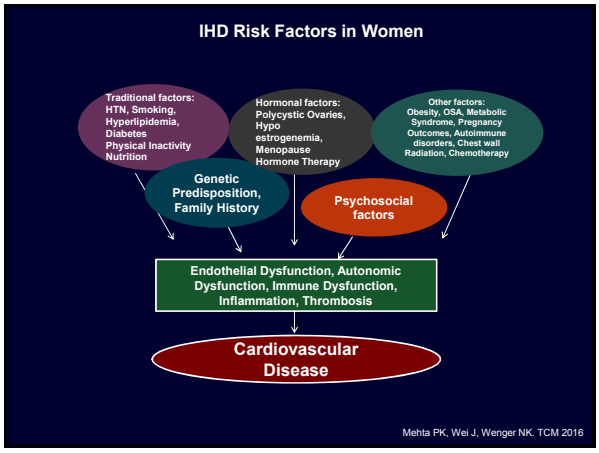
Treatment

- Tobacco cessation
- Cardiac Rehabilitation – Angina/IHD
- Mediterranean diet
- Sleep hygiene/treat sleep apnea
- Treat risk factors – DM, HTN, Hyperlipidemia, etc
- Stress management/depression treatment



Brain-Heart Connection

- Mental stress myocardial ischemia
- Takotsubo Cardiomyopathy

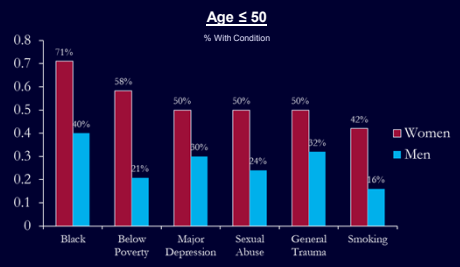


Psychosocial Factors

- Low Socioeconomic Status/Income
- Marital Stress
- Work/Job Stress
- Anxiety
- Depression/hopelessness
- Anger
- Hostility
- Smaller social networks/social isolation
- Caregiver strain
- Early life adversity
- Optimism (protective)

Young Women with Recent MI Have More Psychosocial/Behavioral Risk Factors Than Men

Myocardial Infarction and Mental Stress Study 1 (MIMS1)



Vaccarino et al. Psychosom Med 2014

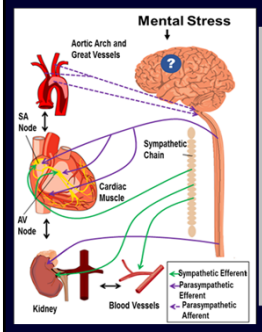
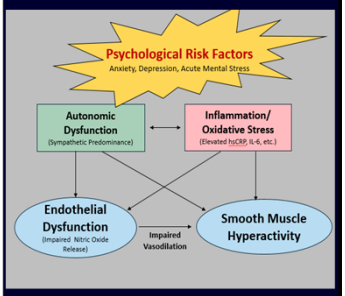
Brain-Heart Axis



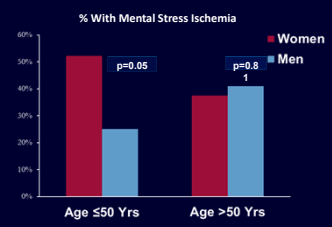


Mehta PK…Vaccarino et al. PSM 2019

Mental Stress Induced Myocardial Ischemia (MSIMI)

- Powerful emotions trigger Angina/MIs
- 3X MACE (independent of cardiac risk factors or presence of exercise-induced ischemia)
- Different mechanism compared to exercise stress– doesn't always accompany physical (exercise/pharm) stress ischemia
- Independent of CAD severity
- Correlates with daily life ischemia
- Marker of susceptibility to emotional stress

Young Women with MI Have More Mental Stress-Induced Myocardial Ischemia



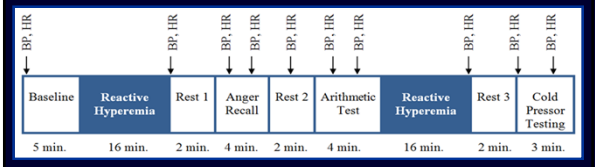
- 98 men and women ≤60 years
- MI in previous 6 months
- SPECT with [99mTc] sestamibi at rest, mental stress, exercise/pharmacologic stress

- No sex differences in exercise-stress ischemia

Vaccarino V et al. Psychosomatic Medicine 2014; 76: 171-180

Cardiac Autonomic Nervous System (CANS) Study: Mental Stress Testing Protocol

- Women with Coronary Vascular Dysfunction (Functional Angiogram)
- Asymptomatic Controls: Age and BMI matched, no risk factors, and normal ETT



Mehta PK et al. IJC 2017

Hemodynamic Changes to Mental Stress

		Cases Median [min, max] n = 44	Reference Control Subjects Median [min, max] n = 17	p-value
Baseline	HR	67 [47, 90]	61 [50, 83]	0.27
	SBP	115 [90, 165]	116 [94, 145]	0.70
Anger	ΔHR	12 [2, 42]	11 [6, 52]	0.49
	ΔSBP	18 [2, 50]	22 [-4, 54]	0.88
Arithmetic	ΔHR	10 [-1, 53]	17 [-6, 41]	0.08

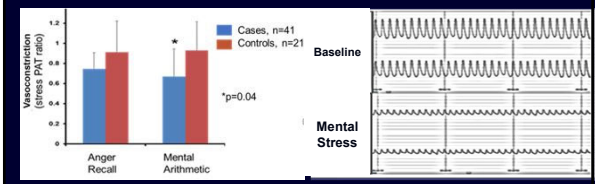
Cold Pressor	ΔHR	1 [-21, 30]	-1 [-14, 17]	0.90
	ΔSBP	19 [-15, 60]	21 [-4, 40]	0.60

Mehta PK et al. IJC 2017

Greater Mental Stress Peripheral Vasoreactivity in Women with Coronary Vascular Dysfunction



Peripheral vasoconstriction inversely correlated with anxiety (r=-3.4, p=0.03), frustration (r=-0.37, p=0.02), & feeling challenged (r=-0.37, p=0.02) in cases but not controls.

Mehta PK et al. IJC 2017

Conclusions

- Ischemia and no obstructive coronary artery disease (INOCA) is highly prevalent and not benign.
- A subgroup of INOCA patients have coronary microvascular dysfunction (CMD), which is associated with adverse CV outcomes.
- Anti-anginal, anti-atherosclerotic, and anti-ischemic therapies, as well as non-pharmacologic approaches can be helpful.
- Large, randomized, therapeutic clinical trials in CMD are lacking, partly due to it's heterogeneous nature, and partly because of lack of diagnostic criteria.
