Introduction: How to run Minecraft data can be saved to a removable USB drive. You may be asking why someone would want to do something like that, and the answer is simple. You may be on a school computer where you can not download files or access games online, Minecraft to them, just plug it into the USB and you're ready to go. You may just be wanting to play Minecraft on another computer for any reason without leaving evidence you did, insert USB and have fun! Thank you for reading this Instructible. Step 1: Download Minecraft Then, then, you have already bought Minecraft, you are going to want to head to the main Minecraft page Once you are on the main page, you will see a login button at the top right of the page. Click on this button and fill in your login information. After logging in, press the Orange download button and you will see a large page full of text. This tutorial is based on Windows, so the file you download will be different if you are on Mac OSX or if you are on Linux. Click the blue colored text Minecraft.exe file. Now, you should move that file to your USB drive. To do this, find the file you downloaded and then lock it to the folder of the USB drive. You should see that there is now a Minecraft.exe file on your USB drive. Double click on that and you will find yourself with a dialog "Download Run Time". This is normal, and it will only take a few minutes to downloading it. It may seem like nothing is happening, but wait and trust me. I didn't think anything was happening because it was taking so long to set the runtime so I canceled and corrupted the Minecraft file and had to re-download it. Step 3: Step 3: Configure the launcher Once the launcher is up and running, you may be asked to log into your Minecraft account. Do this and you will now find a page similar to the one shown in the first image. What you will want to do now is click on the button "Edit Profile" that I have marked in the second image. There are a couple of changes we need to make so that the launcher knows that we want the files to be stored in USB drive instead of the default directory. The first thing we need to change is the Game Directory. This box will not be checked by default, you will have to enter the name of the USB drive into the box followed by:/.minecraft, as I did in the fourth picture. The name of your unit's letter probably differs from mine because I have multiple units in use at the same time. The next step you want to do is tell the launcher to use the Runtime that was set to the USB drive directory. This step is not always necessary, but it is more reliable if you check the box next to "Executable" under the Java configuration area of the profile editor menu. The last thing we will want to change in this menu is the name of the profile. You can call this whatever you want, but I would recommend changing it to something with USB in the name so that you are using this USB drive. After you have done all this, click on the Save Profile button and you are ready to play. Step 4: Step 4: Step 4: Enjoy! Now, all you have to do is make sure that your USB drive, so you can play this from any computer without worrying about leaving the files behind. 1 Person made This project!
