National Interagency Coordination Center Incident Management Situation Report Friday, December 20, 2019 – 0800 MT National Preparedness Level 1

National Fire Activity (December 13 – December 19, 2019)

Initial attack activity:	Light (466 new fires)
New large incidents:	2
Large fires contained:	1
Uncontained large fires:***	1
Area Command teams committed:	0
NIMOs committed:	0
Type 1 IMTs committed:	0
Type 2 IMTs committed:	0

Nationally, there is 0 large fire being managed under a strategy other than full suppression. *** Uncontained large fires include only fires being managed under a full suppression strategy.

Link to Geographic Area daily reports.

Link to Understanding the IMSR.

This report will post every Friday at 0800 Mountain Time unless significant activity occurs.

Thirty-three wildland fire personnel are assigned to support large fires in New South Wales, Australia.

Prescribed Fires and Acres from December 13, 2019 to December 19, 2019 (by Ownership):

***Prescribed fire acres are for reference only and may not reflect the most up-to-date information. ***Official prescribed fire accomplishment reporting occurs through agency specific systems of record.

Predictive Services Discussion: The high pressure ridge over the Intermountain West will move east to the Continental Divide by Friday night and allow for a pattern change to an active wet and snowy pattern to occur. The first system will begin impacting the West on Sunday as it splits into two and sends the northern, weaker half of the system east across northern California and the Great Basin through Monday. The stronger, southern half of the system will intensify and move south along the Californian Coast where it will move into Baja California on Tuesday. The next system will arrive into the Pacific Northwest, Northern Rockies, and Northern California on Christmas Day. Light to moderate snow is expected at all elevations. Western Idaho will not likely begin seeing snow until late in the day. This system will be followed by another on Thursday. On Friday, a ridge of high pressure will redevelop along the West Coast; this could indicate a return to drier than average conditions for the week of New Years. In the East, overall dry and warm conditions are expected. The exception to this will be the passage of a strong, wet low pressure area that will move east from Texas along the northern Gulf Coast over the weekend. Heavy rainfall is expected across Florida, southern Alabama, and Southern during this time.

Unburned Fuel Between You And The Fire

Operational Engagement Category

It is important for firefighters to recognize unburned fuel between themselves and the fire as Watchout Situation #11. Often it is not possible or practical for direct attack on a fire. Before attempting indirect attack and any time the firefighter is in a position where there is unburned fuel between them and the fire, the following questions must be addressed immediately:

- Can you see the fire or are you in contact with someone who can? Discuss situations you might find yourself in where you are out in the green and cannot see the fire. What can you do?
- Is fire spread in a direction away from you? Do you consider the potential for fire spread? Are you safe if the wind switches?
- Will your position be defensible when the fire reaches you? Talk about what must be taken into account when building indirect line or approaching a fire through the green.
- Is your line anchored? Discuss how you anchor indirect line.
- Are your escape routes and safety zones adequate? What is adequate?
- Are weather indicators constantly changing?
- To reduce the risks:
 - Post lookouts.
 - Consider a different location. Review situations where you constructed indirect line or approached a fire through the green and how you provided for your safety.
