1. When we dissolve a cube of sugar in one cup of water, we create a homogeneous mixture. Such mixture is called a solution. The sugar is the solute and water is the solvent.
2. The molarity of a solution is defined as the moles of solute per liter of solution. Molarity is abbreviated as $M$. When the solvent is water, we have an aqueous solution.
3. A 3 M aqueous calcium nitrate solution contains $\mathrm{Ca}\left(\mathrm{NO}_{3}\right)_{2}$ in $\mathbf{H}_{2} \mathbf{O}$. We can write the molarity of this solution as unit factor as follows: moles/liter ( ${ }^{\mathrm{mol}} / \mathrm{L}$ ).
4. One liter calcium nitrate solution contains one mole of calcium ions and two moles of nitrate ions.
5. The concentration of a solution can also be expressed in mass percent. A $5 \%$ aqueous sodium bromide solution contains 5 grams NaBr in 100 g of solution. We can write the mass percent of a solution as a unit factor as follows: grams/grams x $\mathbf{1 0 0 \%}$ ( ${ }^{\mathrm{w} / w} \%$ ).
6. What is the number of moles of silver nitrate in a 125 mL solution that is 0.125 M ? 0.0156 moles $\mathbf{A g N O}_{3}$ You should recognize from question 2 that 0.125 M is the same as $0.125 \mathrm{~mol} / 1 \mathrm{~L}$. Moles $=125 \mathrm{~mL}$ solm. $\times \frac{1 \mathrm{~L}}{1000 \mathrm{~mL}} \times \frac{0.125 \mathrm{~mol}^{2} \mathrm{AgNO}_{3-}}{1 \mathrm{~L} \text { soln. }}=0.015625$ moles $\mathrm{AgNO}_{3} \ldots 3$ sig figs... 0.0156 moles
7. How many grams of calcium acetate are present in 225 mL solution that is 1.20 M ? $42.7 \mathrm{~g} \mathrm{Ca}\left(\mathrm{C}_{2} \mathbf{H}_{3} \mathrm{O}_{2}\right)_{2}$ 225 mL soln. $\times \frac{1 \mathrm{~L}}{1000 \mathrm{~mL}} \times \frac{1.20 \mathrm{~mol} \mathrm{Ca}\left(\mathrm{C}_{2} \underline{H}_{2} \underline{O}_{2}\right]_{2}}{1 \mathrm{~L} \text { soln. }} \times \frac{158.17 \mathrm{~g} \mathrm{Ca}\left(\mathrm{C}_{2} \underline{H}_{3} \underline{\mathrm{O}}_{2}\right)_{2}}{1 \mathrm{~mol} \mathrm{Ca}\left(\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}\right)_{2}}=42.7059 \ldots 3$ sig figs...
8. What mass of glucose, $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$, is needed to prepare a $250 . \mathrm{mL}$ of solution that is 1.50 M glucose solution? Note: the decimal point indicates that the zero is significant. By this point you can probably convert mL to L on your own. 0.250 L soln. $\times \frac{1.50 \mathrm{~mol} \mathrm{C}_{6} \underline{H}_{\underline{+2}} \underline{\mathrm{O}}_{6}}{1 \mathrm{~L} \text { soln. }} \times \frac{180.18 \mathrm{~g} \mathrm{C}_{6} \underline{H}_{12} \underline{\mathrm{O}}_{6}}{1 \mathrm{~mol} \mathrm{C}_{6} \mathrm{H}_{42} \mathrm{O}_{6}}=67.5675 \ldots 3$ sig figs $\ldots 67.6 \mathrm{~g} \mathrm{C}_{6} \mathbf{H}_{\mathbf{1 2}} \mathbf{O}_{\mathbf{6}}$
9. What volume of a 0.150 M NaOH solution contains 2.50 g of sodium hydroxide?

Remember that in dimensional analysis, the numerator and denominator are allowed to trade places so long as the proportion remains the same. (It's the equivalent of multiplying by 1.) You'll see here that the molar mass ( $\mathrm{g} / \mathrm{mol}$ ) and concentration ( $\mathrm{mol} / \mathrm{L}$ ) are 'upside down.' If you happened to perform the dimensional analysis beginning with the concentration, you will end up with $1 / \mathrm{L}$ or $\mathrm{L}^{-1}$. To get the unit in the right place, you simply need to take invert your answer. That is $1 /\left({ }^{1} / \mathrm{L}\right)$ to get L .
$2.50 \mathrm{~g} \mathrm{NaOH} . \times 1 \mathrm{~mol} \mathrm{NaOH} \times \quad \mathrm{XL} \mathrm{NaOH}=0.41666 \ldots 3$ sig figs... $0.417 \mathbf{L ~ N a O H}$ $40.00 \mathrm{~g} \mathrm{NaOH} . \quad 0.150 \mathrm{~mol} \mathrm{NaOH}$
You can also take the definition of molarity, $\mathrm{M}=\mathrm{mol} / \mathrm{L}$, and the definition of molar mass, $\mathrm{mm}=\mathrm{g} / \mathrm{mol} \ldots$ solve for mol in the latter $(\mathrm{mol}=\mathrm{g} / \mathrm{mm})$ and plug it into the former to get $\mathrm{M}=\mathrm{g} /(\mathrm{mm*} \mathrm{~L})$. Solving for liters gives $\mathrm{L}=\mathrm{g} /(\mathrm{mm} * \mathrm{M})$. It's the same!
10. What is the molarity of potassium chlorate prepared my mixing 45.0 g of $\mathrm{KClO}_{3}$ to make $600 . \mathrm{mL}$ solution? $45.0 \mathrm{~g} \mathrm{KClO}_{3} \times \frac{1 \mathrm{~mol} \mathrm{KClO}_{3}}{} \times \frac{1}{}=1.918 \mathrm{~mol} / \mathrm{L} \ldots 3 \mathrm{sig}$ figs $\ldots 1.92 \mathbf{~ M}$ $39.10 \mathrm{~g} \mathrm{KClO}_{3}^{-}=0.600 \mathrm{~L}$ soln
11. Given a 2.0 M ammonium sulfide, $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{~S}$ :
a. What is the molarity of ammonium ions?
$\frac{2.0 \mathrm{~mol}\left(\mathrm{NH}_{4}\right)_{2} \mathrm{~S}}{1 \mathrm{~S} \text { soln. }} \times \frac{2 \mathrm{~mol} \mathrm{NH}_{4}{ }^{+}}{1 \mathrm{~mol}\left(\mathrm{NH}_{4}\right)_{2} \mathrm{~S}}=4.0 \mathrm{~mol} / \mathrm{L} \ldots 2$ sig figs $\ldots 4.0 \mathrm{M} \mathrm{NH}_{4}{ }^{+}$
b. What is the molarity of the sulfide ions?
$2.0 \mathrm{~mol}\left(\mathrm{NH}_{4}\right)_{2} \underline{2} \mathrm{~S}$ $\qquad$ $=2.0 \mathrm{~mol}_{\mathrm{L}}^{\mathrm{L}} \ldots 2$ sig figs $\ldots \mathbf{2 . 0} \mathbf{M} \mathbf{S}^{\mathbf{2 -}}$
1 L soln. $\quad 1 \mathrm{~mol}\left(\mathrm{NH}_{4}\right)_{2} \overline{\mathrm{~S}}$
12. What is the molarity of the individual ions in a 225 mL solution that contains 12.5 g of aluminum sulfate?
$\frac{12.5 \mathrm{~g} \mathrm{Al}_{2}\left(\mathrm{SO}_{4}\right)_{3}}{0.225 \mathrm{~L} \text { soln. }} \times \frac{1 \mathrm{~mol} \mathrm{Al}_{2}\left(\mathrm{SO}_{4}\right)_{3}}{342.17 \mathrm{~g} \mathrm{Al}_{2}\left(\mathrm{SO}_{4}\right)_{3}} \times \frac{5 \mathrm{~mol} \text { ions }}{1} \frac{\mathrm{~mol} \mathrm{Al}}{2}\left(\mathrm{SO}_{4}\right)_{3} \quad=0.8118^{\mathrm{mol}} / \mathrm{L} \ldots 3$ sig figs $\ldots \mathbf{0 . 8 1 2} \mathbf{M}$ total ions
13. If 117 g of a compound are dissolved in 500.0 mL of water to give 4.0 M solution, what is the molar mass of this compound?

See the explanation in problem 8 on how to use the definition of molar mass and molarity. The equations can be arranged to: $\mathrm{mm}=\mathrm{g} /\left(\mathrm{L}^{*} \mathrm{M}\right)$ or $\ldots$
117 g Unknown $\times \quad 1$ L soln__ $\quad=58.50 \mathrm{~g} / \mathrm{mol} \ldots 2$ sig figs $\ldots 58 \mathrm{~g} / \mathrm{mol}$ 0.500 Lsoln. $\quad 4.0 \mathrm{~mol}$ Unknown
