

# Organic Reactions Summary

For Use as a Study Guide

Beauchamp

**Important acid/base reactions used in the examples below.** Write out every one of these easy mechanisms.

<u>Acid</u>	<u>Base</u>	<u>New Base</u>	<u>Comments</u>
 <p>carboxylic acids</p>	<p>sodium hydroxide</p> $\text{Na}^{\oplus} \text{O}^{\ominus}\text{—H}$ $K_{\text{eq}} = \frac{K_a(\text{RCO}_2\text{H})}{K_a(\text{H}_2\text{O})}$ $K_{\text{eq}} = \frac{10^{-5}}{10^{-16}} = 10^{+11}$	 <p>carboxylates</p>	<p>Carboxylates are good nucleophiles, S<sub>N</sub>2 &gt; E2 at Me, 1° and 2° RX</p>
 <p>alcohols</p>	<p>sodium hydride</p> $\text{Na}^{\oplus} \text{H}^{\ominus}$ $K_{\text{eq}} = \frac{K_a(\text{ROH})}{K_a(\text{H}_2)}$ $K_{\text{eq}} = \frac{10^{-17}}{10^{-35}} = 10^{+18}$	 <p>alkoxides</p>	<p>alkoxides are OK nucleophiles, S<sub>N</sub>2 &gt; E2 at Me and 1° RX, and strong bases, E2 &gt; S<sub>N</sub>2 at 2° and 3°RX.</p>
 <p>thiols</p>	<p>sodium hydroxide</p> $\text{Na}^{\oplus} \text{OH}^{\ominus}$ $K_{\text{eq}} = \frac{K_a(\text{RSH})}{K_a(\text{H}_2\text{O})}$ $K_{\text{eq}} = \frac{10^{-8}}{10^{-16}} = 10^{+8}$	 <p>thiolates</p>	<p>thiolates are good nucleophiles, S<sub>N</sub>2 &gt; E2 at Me, 1° and 2° RX, and strong bases, E2 &gt; S<sub>N</sub>2 at 3°RX.</p>
 <p>terminal alkynes</p>	<p>sodium amide</p> $\text{Na}^{\oplus} \text{NR}_2^{\ominus}$ $K_{\text{eq}} = \frac{K_a(\text{RCCH})}{K_a(\text{HNR}_2)}$ $K_{\text{eq}} = \frac{10^{-25}}{10^{-37}} = 10^{+12}$	 <p>terminal acetylides</p>	<p>terminal acetylides are OK nucleophiles, S<sub>N</sub>2 &gt; E2 at Me and 1° RX, and strong bases, E2 &gt; S<sub>N</sub>2 at 2° and 3°RX.</p>
 <p>diisopropylamine</p>	<p>n-butyl lithium</p> $\text{Li}^{\oplus} \text{n-Bu}^{\ominus}$ $K_{\text{eq}} = \frac{K_a(\text{HNR}_2)}{K_a(\text{H-C}_4\text{H}_9)}$ $K_{\text{eq}} = \frac{10^{-37}}{10^{-50}} = 10^{+13}$	 <p>LDA = lithium diisopropylamide;</p>	<p>LDA is a very strong base that is also very sterically hindered, it always acts as a base in our course.</p>
 <p>ketones / aldehydes</p>	<p>LDA = lithium diisopropylamide</p> $\text{Na}^{\oplus} \text{NR}_2^{\ominus}$ $K_{\text{eq}} = \frac{K_a(\text{RCOCH}_3)}{K_a(\text{HNR}_2)}$ $K_{\text{eq}} = \frac{10^{-20}}{10^{-37}} = 10^{+17}$	 <p>ketone enolates</p>	<p>enolates are good nucleophiles, S<sub>N</sub>2 &gt; E2 at Me, 1° and 2° RX, and strong bases, E2 &gt; S<sub>N</sub>2 at 3°RX.</p>

 <p>esters</p>	<p>LDA = lithium diisopropylamide</p> $\xrightarrow{\text{Na}^{\oplus} \ominus \text{NR}_2}$ $K_{\text{eq}} = \frac{K_a(\text{ROCOCH}_3)}{K_a(\text{HNR}_2)}$ $K_{\text{eq}} = \frac{10^{-25}}{10^{-37}} = 10^{+12}$	 <p>ester enolates</p>	<p>enolates are good nucleophiles, <math>S_N2 &gt; E2</math> at Me, <math>1^\circ</math> and <math>2^\circ</math> RX, and strong bases, <math>E2 &gt; S_N2</math> at <math>3^\circ</math>RX.</p>
 <p>carboxylic acids</p>	<p>LDA = lithium diisopropylamide</p> $\xrightarrow{2 \text{ eqs. Na}^{\oplus} \ominus \text{NR}_2}$ $K_{\text{eq}} = \frac{K_a(\ominus \text{O}_2\text{CCH}_3)}{K_a(\text{HNR}_2)}$ $K_{\text{eq}} = \frac{10^{-25}}{10^{-37}} = 10^{+12}$	 <p>acid dianion</p>	<p>enolates are good nucleophiles, <math>S_N2 &gt; E2</math> at Me, <math>1^\circ</math> and <math>2^\circ</math> RX, and strong bases, <math>E2 &gt; S_N2</math> at <math>3^\circ</math>RX.</p>
 <p>nitriles</p>	<p>LDA = lithium diisopropylamide</p> $\xrightarrow{2 \text{ eqs. Na}^{\oplus} \ominus \text{NR}_2}$ $K_{\text{eq}} = \frac{K_a(\ominus \text{O}_2\text{CCH}_3)}{K_a(\text{HNR}_2)}$ $K_{\text{eq}} = \frac{10^{-30}}{10^{-37}} = 10^{+7}$	 <p>nitrile enolate</p>	<p>enolates are good nucleophiles, <math>S_N2 &gt; E2</math> at Me, <math>1^\circ</math> and <math>2^\circ</math> RX, and strong bases, <math>E2 &gt; S_N2</math> at <math>3^\circ</math>RX.</p>
 <p>Wittig salt = ylid</p>	<p>n-butyl lithium</p> $\xrightarrow{\text{Li}^{\oplus} \ominus \text{n-Bu}}$ $K_{\text{eq}} = \frac{K_a(\text{HCR}_2\text{PPh}_3)}{K_a(\text{H-C}_4\text{H}_9)}$ $K_{\text{eq}} = \frac{10^{-33}}{10^{-50}} = 10^{+17}$	 <p>betaine</p>	<p>n-butyl lithium removes proton from Wittig salt and makes a good nucleophile at ketones and aldehydes, forming alkenes.</p>
 <p>sulfur salt = ylid</p>	<p>n-butyl lithium</p> $\xrightarrow{\text{Li}^{\oplus} \ominus \text{n-Bu}}$ $K_{\text{eq}} = \frac{K_a(\text{HCR}_2\text{SPh}_2)}{K_a(\text{H-C}_4\text{H}_9)}$ $K_{\text{eq}} = \frac{10^{-33}}{10^{-50}} = 10^{+17}$	 <p>betaine</p>	<p>n-butyl lithium removes proton from sulfur salt and makes a good nucleophile at ketones and aldehydes, forming epoxides.</p>
 <p>dithiane</p>	<p>n-butyl lithium</p> $\xrightarrow{\text{Li}^{\oplus} \ominus \text{n-Bu}}$ $K_{\text{eq}} = \frac{K_a(\text{dithiane})}{K_a(\text{H-C}_4\text{H}_9)}$ $K_{\text{eq}} = \frac{10^{-33}}{10^{-50}} = 10^{+17}$	 <p>dithiane carbanion</p>	<p>n-butyl lithium removes proton from dithiane and makes a good nucleophile at all of our electrophiles. It can react once or twice in <math>S_N2</math> reactions. Sulfur acetal forms carbonyl group after hydrolysis using <math>\text{Hg}^{+2}</math>. Makes aldehydes and ketones.</p>

**Arrow-Pushing schemes for the above reactions**

**Organometallics used in our course (Mg, Li and Cu)**

**S<sub>N</sub>2 versus E2 choices at 2°RX.**

At secondary RX (X= OTs, I, Br, Cl) S<sub>N</sub>2 and E2 products are in close competition with each other. Anions whose conjugate acids have higher pK<sub>a</sub>'s (stronger bases have weaker acids) generally produce more E2 relative to S<sub>N</sub>2. The examples that we will emphasize at 2°RX centers are carboxylates (S<sub>N</sub>2 > E2) vs hydroxide and alkoxides (E2 > S<sub>N</sub>2), and cyanide (S<sub>N</sub>2 > E2) vs terminal acetylides (E2 > S<sub>N</sub>2), azide (S<sub>N</sub>2 > E2) vs dialkylamides (E2 > S<sub>N</sub>2) and metal hydrides (S<sub>N</sub>2 > E2) vs simple hydride (E2 > S<sub>N</sub>2). Higher basicity and steric hindrance in either RX or the electron pair donor also favors E2 > S<sub>N</sub>2.

The following examples show similar looking base/nucleophiles (used in our course) that react differently with 2°RX structures. (They all react by S<sub>N</sub>2 at methyl and 1°RX and they all react by E2 at 3°RX.) It is the reactions at 2°RX centers that are ambiguous.

2°RX structures are the most ambiguous.

Less basic, so S <sub>N</sub> 2 > E2.	More basic, so E2 > S <sub>N</sub> 2.	Less basic, so S <sub>N</sub> 2 > E2.	More basic, so E2 > S <sub>N</sub> 2.
$\text{:N}\equiv\text{C:}^{\ominus}$	$\text{R}-\text{C}\equiv\text{C:}^{\ominus}$	$\begin{array}{c} \text{:}\ddot{\text{O}}\text{:} \\ \parallel \\ \text{R}-\text{C} \\ \diagdown \\ \text{:}\ddot{\text{O}}\text{:}^{\ominus} \end{array}$	$\text{H}-\ddot{\text{O}}\text{:}^{\ominus} \quad \text{R}-\ddot{\text{O}}\text{:}^{\ominus}$
cyanide pK <sub>a</sub> of conjugate acid = 9	terminal acetylides pK <sub>a</sub> of conjugate acid = 25	carboxylates pK <sub>a</sub> of conjugate acid = 5	hydroxide and alkoxides pK <sub>a</sub> of conjugate acid = 16-19
Less basic, so S <sub>N</sub> 2 > E2.	More basic, so E2 > S <sub>N</sub> 2.	Less basic, so S <sub>N</sub> 2 > E2.	More basic, so E2 > S <sub>N</sub> 2.
$\begin{array}{c} \ominus \\ \text{:}\text{N}=\text{N}=\text{N:}^{\ominus} \\ \text{:}\text{N:}^{\ominus} \end{array}$	$\begin{array}{c} \ominus \\ \text{R}-\text{N}-\text{R} \\ \text{:} \end{array}$	$\begin{array}{c} \text{H} \\   \\ \text{H}-\text{B}-\text{H} \\   \\ \text{H} \end{array} \quad \begin{array}{c} \text{H} \\   \\ \text{H}-\text{Al}-\text{H} \\   \\ \text{H} \end{array}$	$\begin{array}{c} \ominus \\ \text{H:} \\ \text{H:} \end{array} \quad \begin{array}{c} \oplus \\ \text{Na} \\ \oplus \\ \text{K} \end{array}$
azide pK <sub>a</sub> of conjugate acid = 5	dialkyl amides pK <sub>a</sub> of conjugate acid = 37	sodium borohydride lithium aluminum hydride pK <sub>a</sub> of conjugate acid = ?	hydrides pK <sub>a</sub> of conjugate acid = 37

# 1. Making RBr from alkane and alkene hydrocarbons and alcohols

**a. RBr from alkanes** - mechanism using  $\text{Br}_2 / h\nu$  for free radical substitution of alkane  $\text{sp}^3$  C-H bonds to form  $\text{sp}^3$  C-Br bonds at the weakest C-H bond.

overall reaction

1. initiation

weakest bond ruptures first

2a propagation

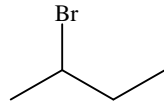

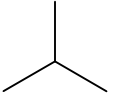

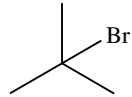

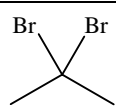

2b propagation

3. termination = combination of two free radicals - relatively rare because free radicals are at low concentrations

## Example reactions

$\text{CH}_4$	$\xrightarrow{\text{Br}_2 / h\nu}$	$\text{H}_3\text{C}-\text{Br}$	achiral
	$\xrightarrow{\text{Br}_2 / h\nu}$		achiral
	$\xrightarrow{\text{Br}_2 / h\nu}$		enantiomers (R and S)
	$\xrightarrow{\text{Br}_2 / h\nu}$		achiral
	$\xrightarrow{2 \text{ Br}_2 / h\nu}$		can do E2 twice, to make alkynes

**b. RBr from alkenes (anti-Markovnikov addition of HBr using free radical chemistry):** mechanism using HBr / ROOR / hv for free radical addition to alkane pi bonds (anti-Markovnikov addition = Br adds to less substituted position to form most stable free radical intermediate, and then H adds to more substituted position)

1. initiation (two steps)

2a propagation

2b propagation

3. termination = combination of two free radicals - relatively rare because free radicals are at low concentrations

### Example reactions

**c. RBr from alkenes (anti-Markovnikov addition of HBr using borane chemistry):** mechanism using 1.  $\text{BH}_3$  2.  $\text{Br}_2 / \text{CH}_3\text{O}^-$  for anti-Markovnikov addition of H-Br to alkane pi bonds (concerted, syn addition of H-BH<sub>2</sub> to alkene pi bond, followed by complex with Br<sub>2</sub> and migration of R group to Br)

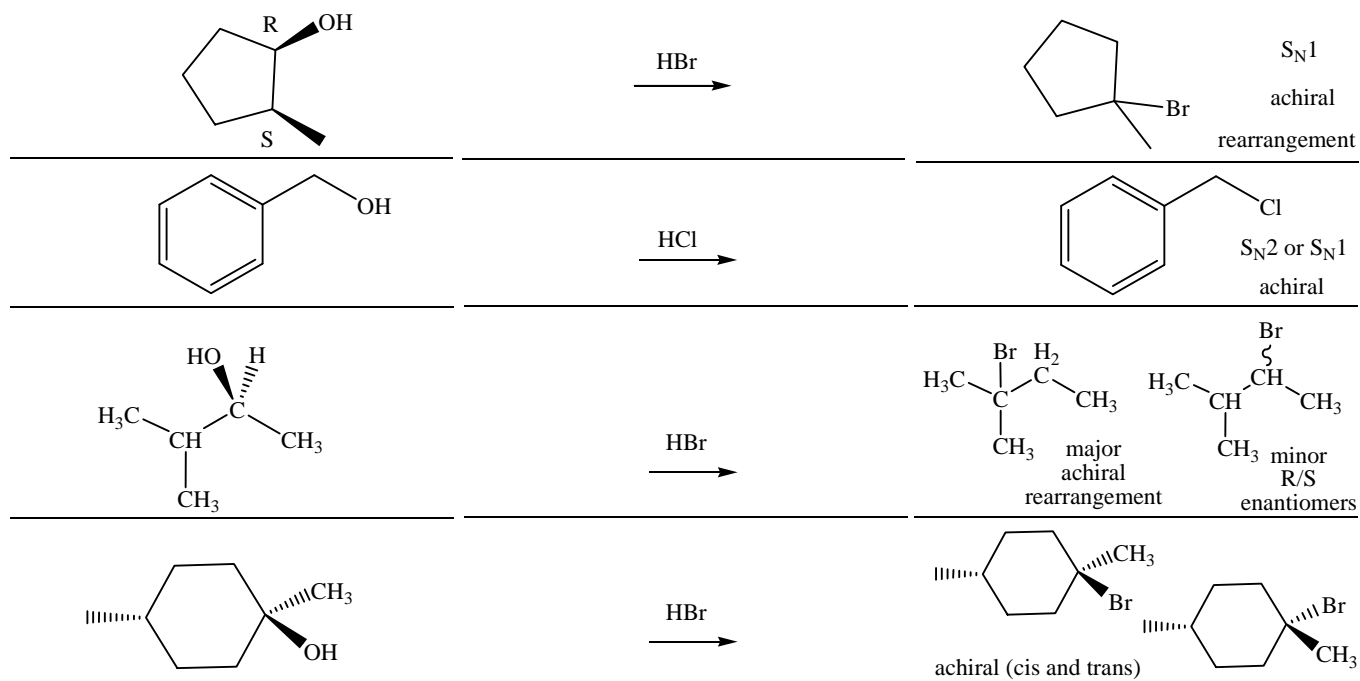

### Example reactions

**d. RBr from alcohols:**

 i. mechanism using HBr  $\text{S}_{\text{N}}2$  at methyl and  $1^\circ$  ROH;  $\text{S}_{\text{N}}1$  at  $2^\circ$  and  $3^\circ$  ROH, with possibility of rearrangements

**Example reactions**

ii. mechanism using  $PBr_3$ :  $S_N2$  at methyl and  $1^\circ$  ROH;  $S_N1$  at  $2^\circ$  and  $3^\circ$  ROH, with possibility of rearrangements

## Example reactions

iii. mechanism using  $SOBr_2$   $S_N2$  at methyl and  $1^\circ$  ROH;  $S_N1$  at  $2^\circ$  and  $3^\circ$  ROH, with possibility of rearrangements

## Example reactions

iv mechanism using 1. TsCl/pyridine 2. NaBr  $\text{S}_{\text{N}}2$  at methyl,  $1^\circ$  and  $2^\circ$  ROH, avoids rearrangements

### Example reactions

## 2. $S_N2$ reactions using RBr compounds:

a. mechanisms using NaOH,  $S_N2$  at methyl and  $1^\circ$  RBr;  $E2 > S_N2$  at  $2^\circ$  and only E2 at  $3^\circ$  RBr,

## Example reactions

b. mechanisms using NaOCH<sub>3</sub>, S<sub>N</sub>2 at methyl and 1° RBr; E2 > S<sub>N</sub>2 at 2° and only E2 at 3° RBr,

### Example reactions

c. mechanisms using  $\text{NaO}_2\text{CCH}_3$ , sodium carboxylates,  $\text{S}_{\text{N}}2$  at methyl  $1^\circ$  and  $2^\circ$  RBr; and only E2 at  $3^\circ$  RBr  
Ester synthesis (can hydrolyze with NaOH (base) to ROH and  $\text{RCO}_2\text{H}$ , providing an alternate approach to secondary alcohols).

### Example reactions

d. mechanism using potassium t-butoxide,  $\text{KOC}(\text{CH}_3)_3$ ,  $\text{S}_{\text{N}}2$  at methyl and E2 at  $1^\circ$ ,  $2^\circ$  and  $3^\circ$  RBr,

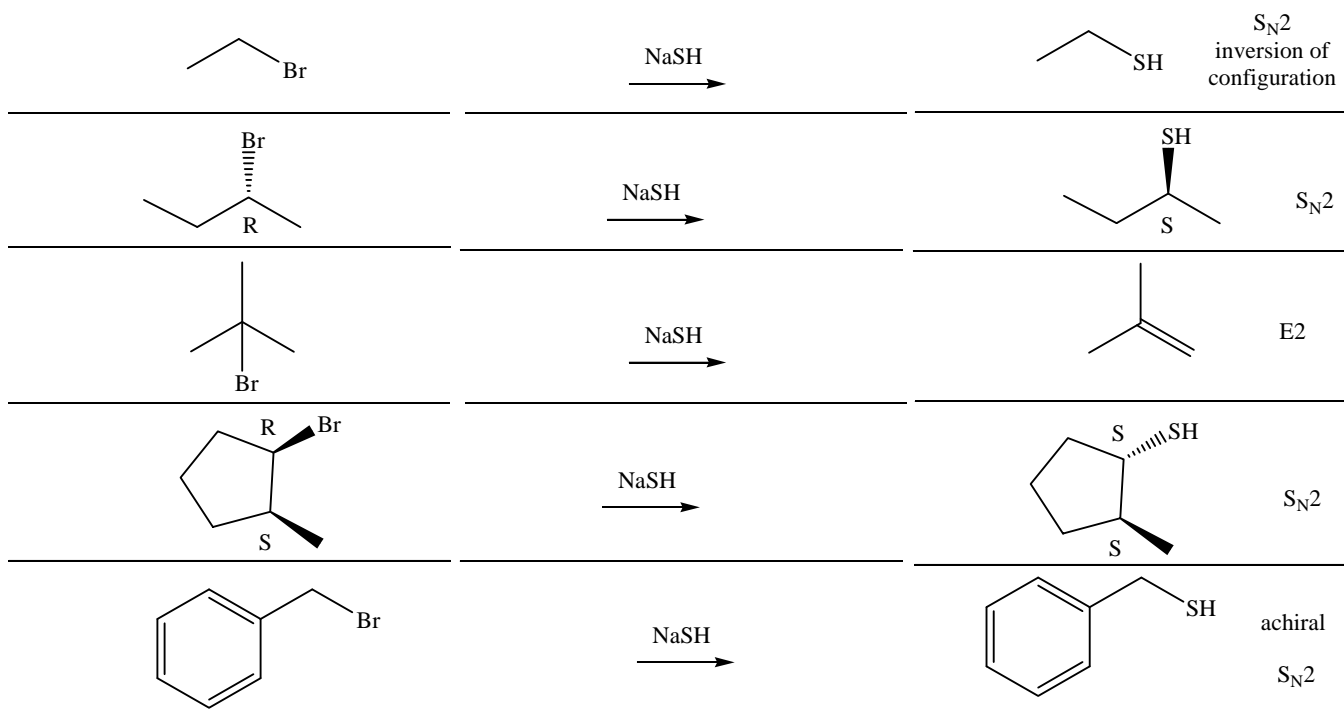

**Example reactions**

e. mechanism using  $\text{NaSH}$ ,  $\text{S}_{\text{N}}2$  at methyl,  $1^\circ$  and  $2^\circ$  RBr and only E2 at  $3^\circ$  RBr,

**Example reactions**

f. mechanism using  $\text{NaSCH}_3$ ,  $\text{S}_{\text{N}}2$  at methyl,  $1^\circ$  and  $2^\circ$   $\text{RBr}$  and only  $\text{E}2$  at  $3^\circ$   $\text{RBr}$ ,

### Example reactions

g. mechanism using NaCN, S<sub>N</sub>2 at methyl, 1° and 2° RBr and only E2 at 3° RBr,

### Example reactions

h. mechanism using NaCC-R, S<sub>N</sub>2 at methyl, 1° and 2° RBr and only E2 at 3° RBr,

**Example reactions**

i. mechanism using 1.  $\text{NaN}_3$ ,  $\text{S}_{\text{N}}2$  at methyl,  $1^\circ$  and  $2^\circ$   $\text{RBr}$  and only  $\text{E}2$  at  $3^\circ$   $\text{RBr}$  2.  $\text{LiAlH}_4$  3. Workup, makes  $1^\circ$  amines ( $\text{RNH}_2$ )

### Example reactions

j. mechanism using 1. Na<sup>+</sup> imidate, S<sub>N</sub>2 at methyl, 1° and 2° RBr and only E2 at 3° RBr 2. NaOH

### Example reactions

k. mechanism using ketone enolates,  $S_N2$  at methyl,  $1^\circ$  and  $2^\circ$  RBr and only E2 at  $3^\circ$  RBr (See acid/base reactions at the beginning for synthesis of LDA.)

### Example reactions

1. mechanism using ester enolates, S<sub>N</sub>2 at methyl, 1° and 2° RBr and only E2 at 3° RBr,

### Example reactions

m. mechanism using acid dianion enolates,  $S_N2$  at methyl,  $1^\circ$  and  $2^\circ$  RBr and only E2 at  $3^\circ$  RBr,

### Example reactions

n. mechanism using nitrile enolates, S<sub>N</sub>2 at methyl, 1° and 2° RBr and only E2 at 3° RBr,

### Example reactions

o. mechanism using dithiane anions,  $S_N2$  at methyl,  $1^\circ$  and  $2^\circ$  RBr and only E2 at  $3^\circ$  RBr,

**Example reactions**

**Hydrolysis of thioacetals (one as aldehyde and one as ketone)**

p. mechanism using  $\text{LiAlH}_4$  or  $\text{NaBH}_4$  (and deuterides),  $\text{S}_{\text{N}}2$  at methyl,  $1^\circ$  and  $2^\circ$   $\text{RBr}$  and only  $\text{E}2$  at  $3^\circ$   $\text{RBr}$ ,

### Example reactions

q. mechanism using diphenylsulfide to make diphenylsulfonium salt,  $S_N2$  at methyl,  $1^\circ$  and  $2^\circ$  RBr and only E2 at  $3^\circ$  RBr, used to make a diphenylsulfonium ylids, which are used to make epoxides with aldehydes and ketones.

### Example reactions

r. mechanism using triphenylphosphine to make triphenylphosphonium salt, S<sub>N</sub>2 at methyl, 1° and 2° RBr and only E2 at 3° RBr, used to make a triphenylphosphonium ylid to make Z and E alkenes with aldehydes and ketones.

**Schlosser Modification of the Wittig reaction to make E alkenes**

**Example reactions**

### 3. S<sub>N</sub>1 reactions using RBr compounds:

a. RX compounds with water. S<sub>N</sub>1 conditions form carbocations with possible rearrangements. Alcohol synthesis is the major product with E1 as minor product (unless reaction is run at high temperature).

#### Example reactions

b. RX compounds with alcohols.  $S_N1$  conditions form carbocations with possible rearrangements. Ether synthesis is the major product with E1 as minor product (unless reaction is run at high temperature).

### Example reactions

c. RX compounds with liquid carboxylic acids.  $S_N1$  conditions form carbocations with possible rearrangements. Ester synthesis is the major product with E1 as minor product.

 d. Oxidation of ROH with:  $\text{CrO}_3$  / pyridine (PCC). Synthesis of aldehydes or ketones.

e. Oxidation of ROH with:  $\text{CrO}_3$  / acid / water (Jones). Synthesis of carboxylic acids or ketones.

$\text{CrO}_3$  / acid /  $\text{H}_2\text{O}$   
(Jones)

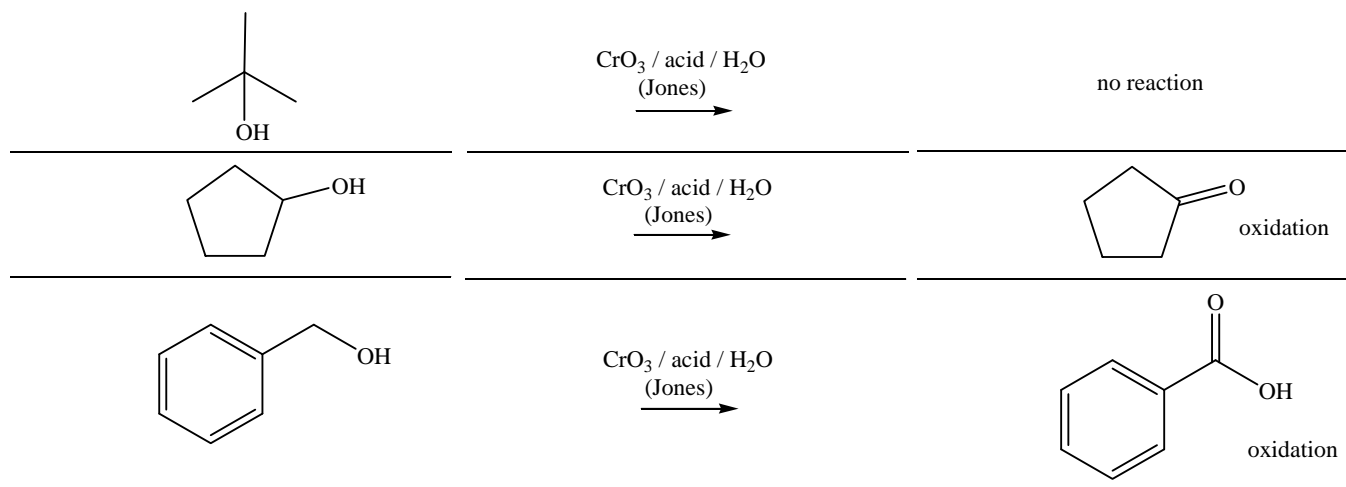

oxidation

$\text{CrO}_3$  / acid /  $\text{H}_2\text{O}$   
(Jones)

oxidation

d. Oxidation of ROH with: DMSO / ClOCCOCl / Et<sub>3</sub>N (Swern, many variations). Synthesis of aldehydes or ketones.

e.  $\text{RCO}_2\text{H}$  with thionyl chloride. Synthesis of esters. Amides, thioesters and anhydrides (Need to make  $\text{RCOCl}$  with  $\text{SOCl}_2$  + acid.) There are a variety of approaches you could propose for this transformation.

ester synthesis from acid chloride and alcohols

amide synthesis from acid chloride and amines

anhydride synthesis from acid chloride and carboxylic acids

f. ROH with acid chlorides. Synthesis of esters. (Need to make  $\text{RCOCl}$  with  $\text{SOCl}_2 + \text{acid}$ .)

g.  $\text{RNH}_2$  with acid chlorides. Synthesis of amides. (Need to make  $\text{RCOCl}$  with  $\text{SOCl}_2 + \text{acid}$ .)

h. RSH with acid chlorides. Synthesis of thioesters. (Need to make RCOCl with SOCl<sub>2</sub> + acid.)

i. RCO<sub>2</sub>H with acid chlorides. Synthesis of anhydrides. (Need to make RCOCl with SOCl<sub>2</sub> + acid.)

j. ROH with sodium hydride, NaH. Synthesis of sodium alkoxides.

k. ROH with sulfuric acid / heat. Synthesis of alkenes (our only useful E1 reaction. Rearrangement is possible).

1. Double elimination from dibromoalkanes to form alkynes and terminal acetylides used in many additional reactions ( $S_N2$  with  $RBr$ ,  $C=O$  addition to aldehydes and ketones, and reaction with epoxides)

The zipper reaction moves a triple bond in an unbranched linear chain to the end and allows all of the above reactions.

j. Formation of conjugate base + addition of epoxide electrophile forms an alkynyl alcohol via  $\text{S}_{\text{N}}2$  reaction.

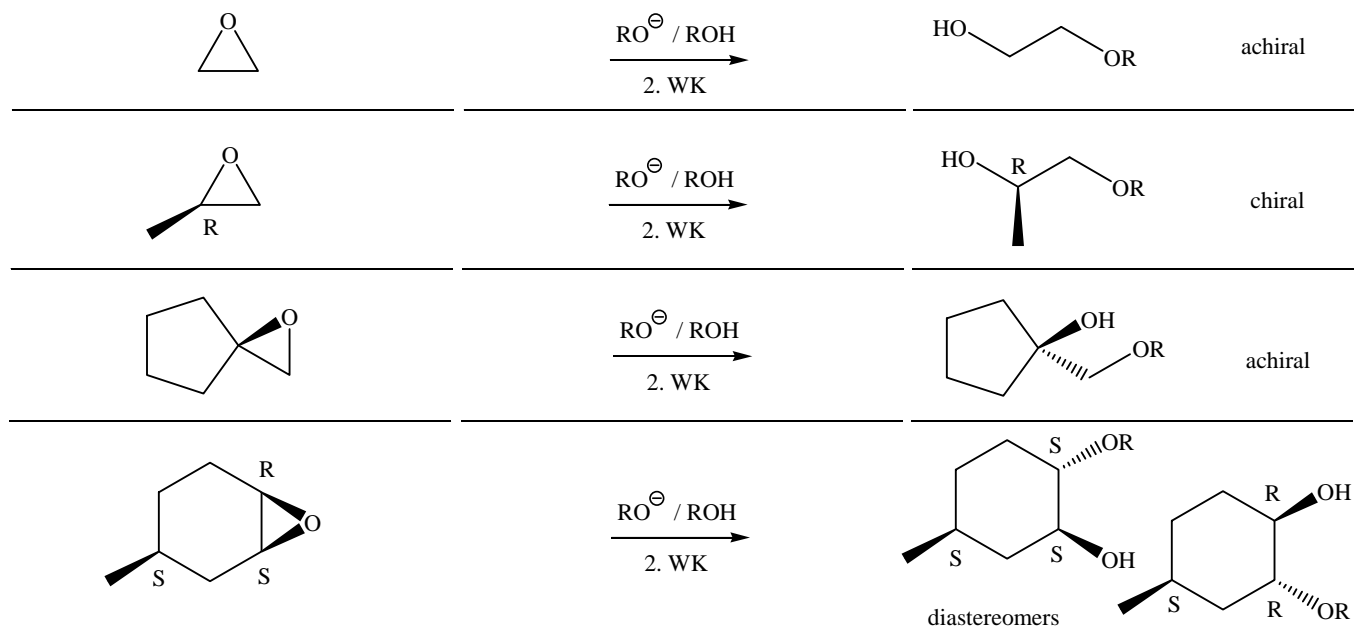

**Epoxide chemistry**

a. Epoxides with aqueous hydroxide (followed by workup = neutralization).

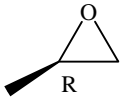

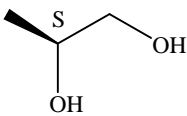

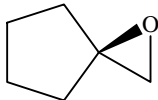

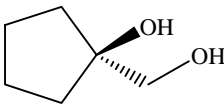

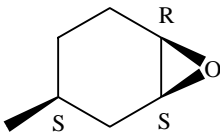

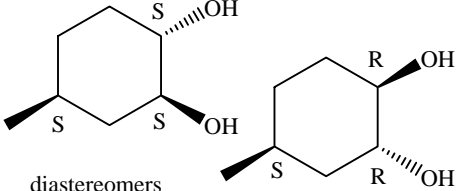

b. Epoxides with alcoholic alkoxide (followed by workup = neutralization).

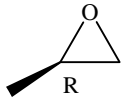

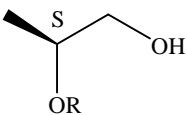

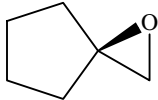

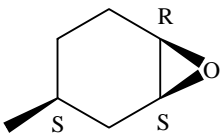

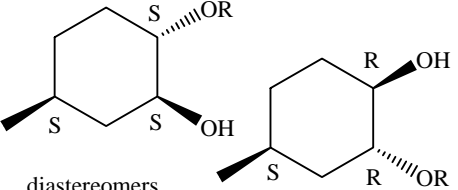

c. Epoxides with aqueous acid.

	$\xrightarrow[\text{2. WK}]{\text{H}_2\text{SO}_4 / \text{H}_2\text{O} \text{ (H}_3\text{O}^+)}$		chiral (inversion)
	$\xrightarrow[\text{2. WK}]{\text{H}_2\text{SO}_4 / \text{H}_2\text{O} \text{ (H}_3\text{O}^+)}$		achiral
	$\xrightarrow[\text{2. WK}]{\text{H}_2\text{SO}_4 / \text{H}_2\text{O} \text{ (H}_3\text{O}^+)}$		diastereomers

## d. Epoxides with alcoholic sulfuric acid.

	$\xrightarrow[\text{2. WK}]{\text{H}_2\text{SO}_4 / \text{ROH} \text{ (ROH}_2^+)}$		achiral
	$\xrightarrow[\text{2. WK}]{\text{H}_2\text{SO}_4 / \text{ROH} \text{ (ROH}_2^+)}$		chiral (inversion)
	$\xrightarrow[\text{2. WK}]{\text{H}_2\text{SO}_4 / \text{ROH} \text{ (ROH}_2^+)}$		achiral
	$\xrightarrow[\text{2. WK}]{\text{H}_2\text{SO}_4 / \text{ROH} \text{ (ROH}_2^+)}$		diastereomers

## e. Epoxides with cyanide (followed by workup = neutralization).

	$\xrightarrow[\text{2. WK}]{\text{NaCN} \text{ DMSO}}$		achiral
	$\xrightarrow[\text{2. WK}]{\text{NaCN} \text{ DMSO}}$		chiral
	$\xrightarrow[\text{2. WK}]{\text{NaCN} \text{ DMSO}}$		achiral

f. Epoxides with terminal acetylides (followed by workup = neutralization).

g. Epoxides with LiAlH<sub>4</sub> (LAH) (followed by workup = neutralization).

h. Epoxides with NaBH<sub>4</sub> (followed by workup = neutralization).

i. Epoxides with cuprates (followed by workup = neutralization).

j. Epoxides with lithium diisopropyl amide (LDA, followed by workup = neutralization).

k. Epoxides with Grignard reagents (followed by workup = neutralization).

l. Epoxides with organolithium reagents (followed by workup = neutralization).

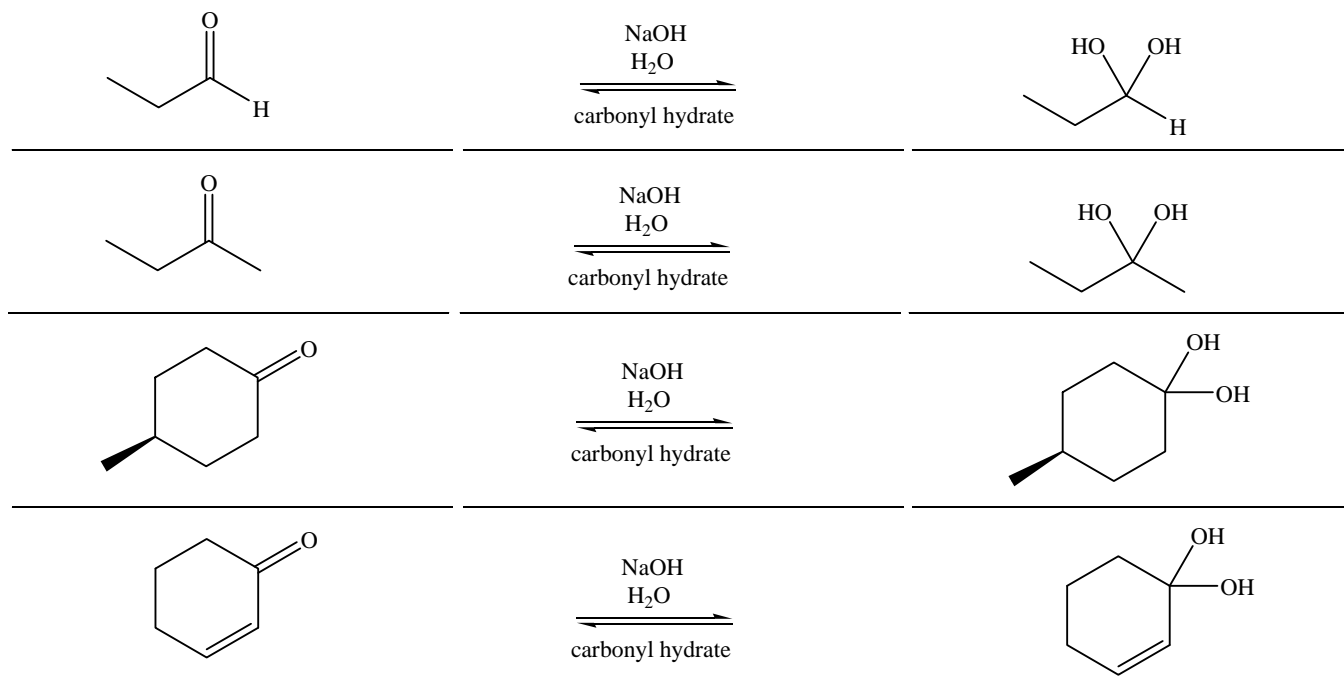

m. Epoxides with conjugate base of phthalimide (followed by hydrolysis and workup = neutralization).

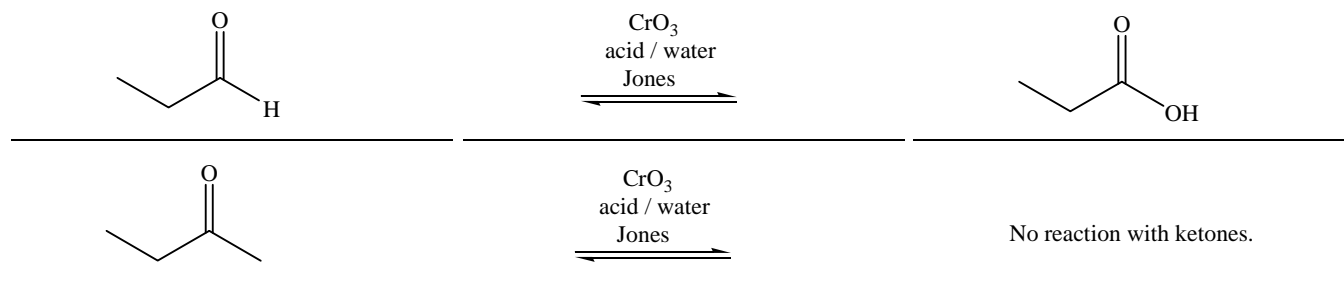

a. Aldehydes and ketones in aqueous acid form carbonyl hydrates.

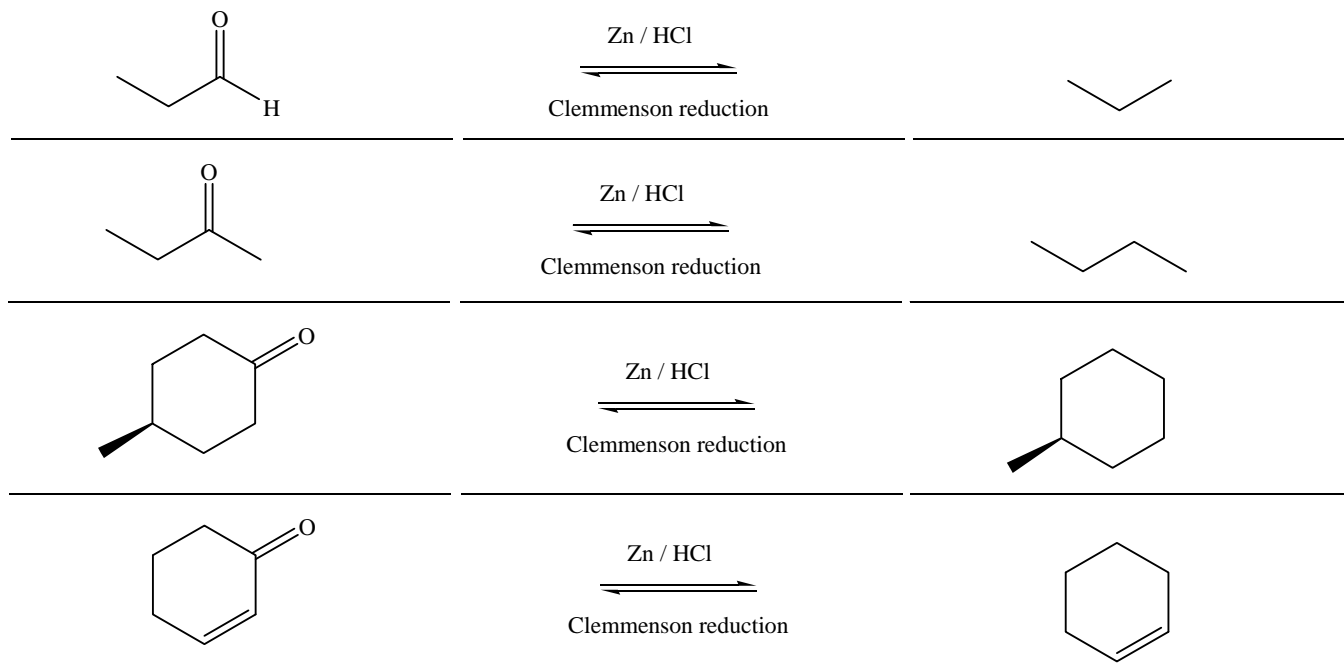

b. Aldehydes and ketones in aqueous base form carbonyl hydrates.

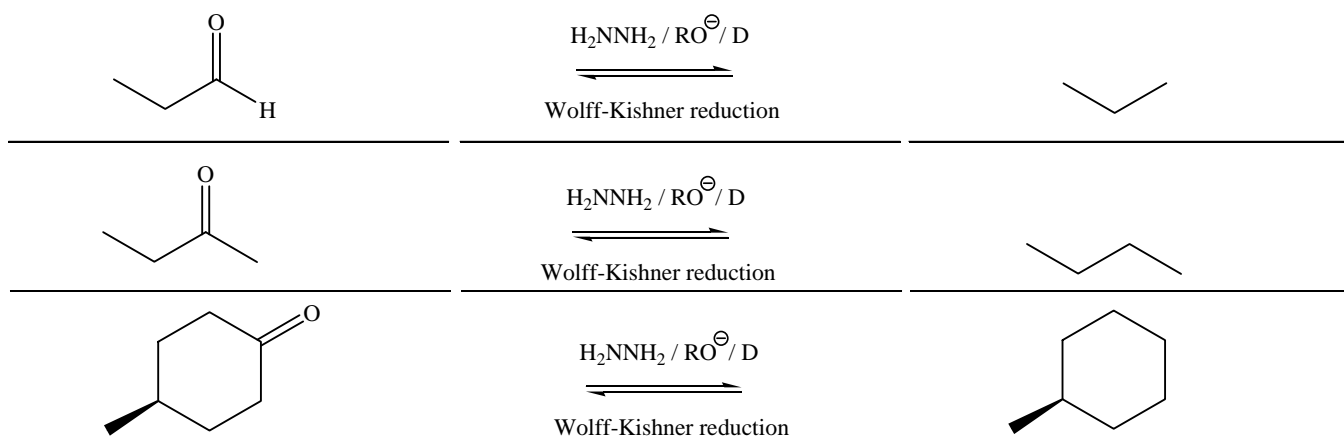

c. Aldehydes and ketones with Jones reagent. Converts aldehydes to carboxylic acids.

d. Aldehydes and ketones with Zn/HCl (Clemmenson reduction).

e. Aldehydes and ketones with hydrazine and base (Wolff-Kishner reduction).

f. Aldehydes and ketones with LiAlH<sub>4</sub> (LAH).

g. Aldehydes and ketones with NaBH<sub>4</sub>.

h. Aldehydes and ketones with cyanide, cyanohydrin synthesis or conjugate addition to alpha-beta unsaturated C=O.

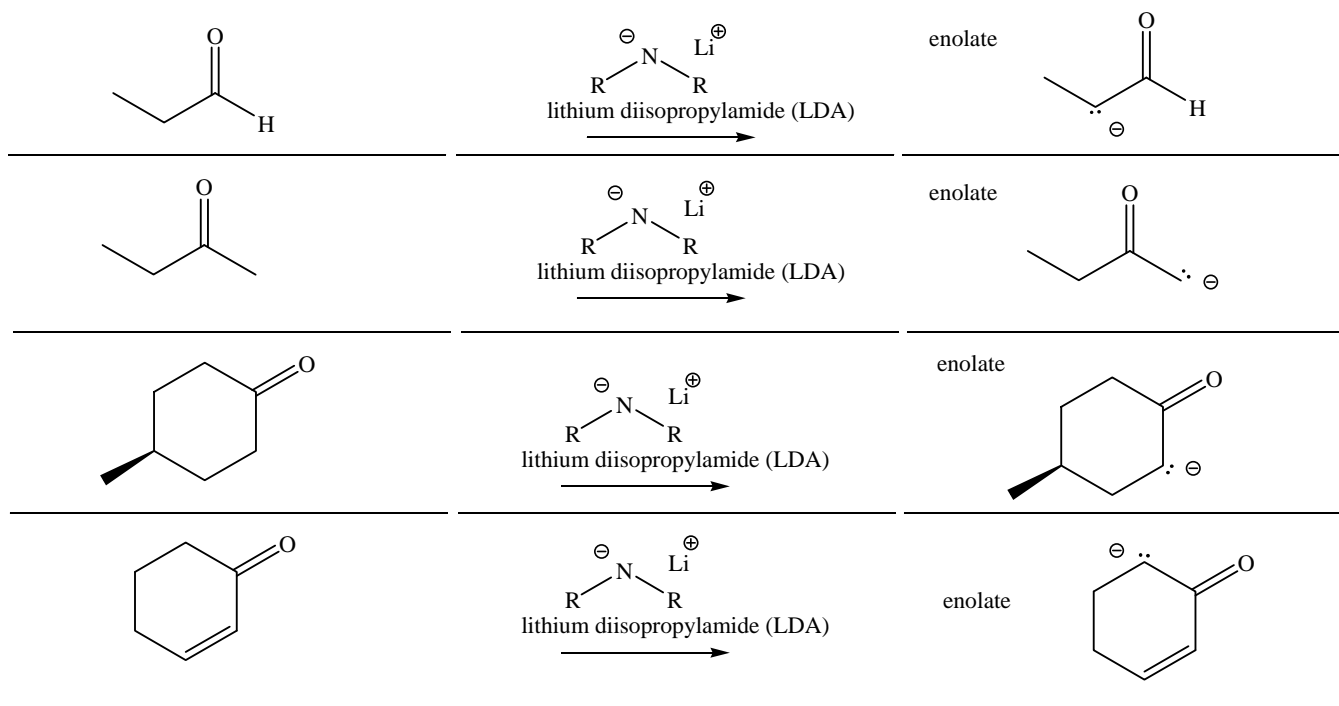

i. Aldehydes and ketones with terminal acetylides.

j. Aldehydes and ketones with LDA makes enolates (carbanion nucleophiles).

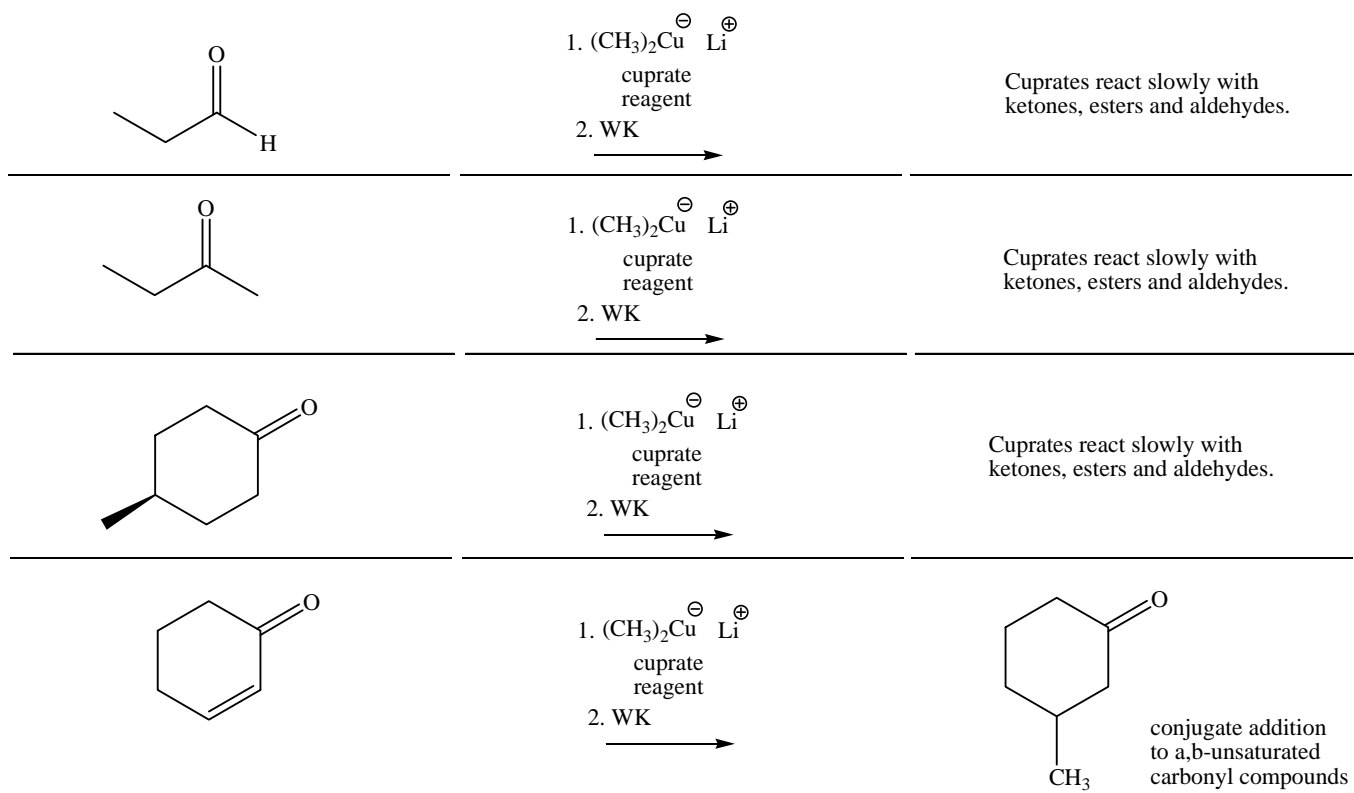

k. Aldehydes and ketones with Grignard (Mg) reagents.

## l. Aldehydes and ketones with organolithium reagents.

## m. Aldehydes and ketones with cuprates.

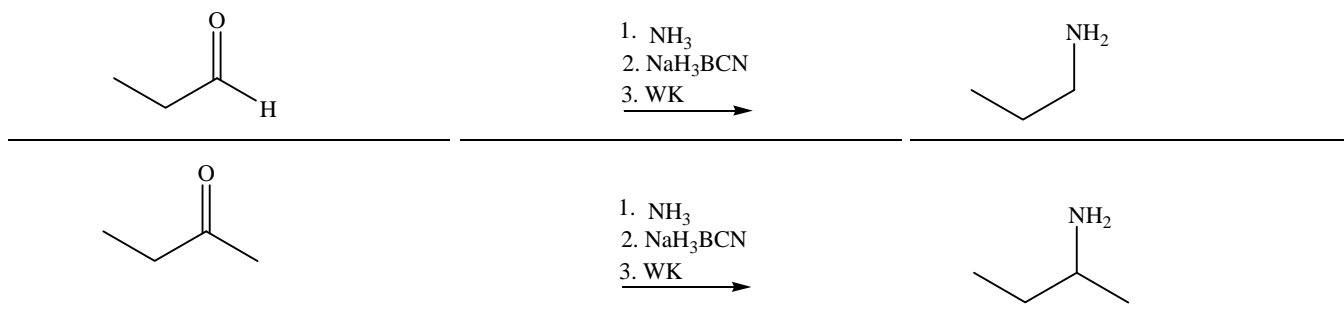

## n. Aldehydes and ketones with secondary amines (enamine synthesis, alkylation, hydrolysis).

## o. Aldehydes and ketones with primary amines (imine synthesis).

p. Aldehydes and ketones with ammonia +  $\text{NaBH}_3\text{CN}$  = primary amine synthesis.

q. Aldehydes and ketones primary amine +  $\text{NaBH}_3\text{CN}$  = secondary amine synthesis.

r. Aldehydes and ketones secondary amine +  $\text{NaBH}_3\text{CN}$  = tertiary amine synthesis.

s. Aldehydes and ketones ethylene glycol, acid, dehydration: ketal and acetal synthesis = protection).

t. Aldehydes and ketones with 1. LDA 2. RX = alkylation of C=O.

u. Aldehydes and ketones with 1. LDA 2. epoxide = alkylation of C=O.

v. Aldehydes and ketones with 1. LDA 2. another C=O = addition to C=O. Forms a beta hydroxyl carbonyl, which can be dehydrated in acid or base (with heat) to an  $\alpha,\beta$ -unsaturated carbonyl compound.

w. Aldehydes and ketones with mCPBA (Baeyer-Villiger oxidation) to form esters (cyclic = lactones).

Show the products of the following miscellaneous reactions.

other possible reactions

cuprates

Sulfur ylids

Phosphorous ylids (4 variations)

Ketals / acetals

Imines → amines → amides
