**Explanation of a Typical Selection And Page**

**ATRALOC Needle**

The needle type and size/shape are shown only for needle/suture combinations. A repeated needle type (eg RB-1, RB-1) indicates a "double-armed" suture, that is, a suture with a needle attached to each end.

**Needle Type/Needle Shape Symbol**

Needle type and needle shape are shown in this subhead.

**Material**

Suture materials are designated by color and construction characteristics (eg Undyed Braided, Violet Braided, etc.)

**Length**

Suture length is shown in both inches and the approximate metric equivalent. Multi-strand means 3 or 8 strands per packet. These products are packaged 12, 24 or 36 packets per box.

The CR mark refers to control release needle sutures.

**Product Name**

Sutures and other ETHICON products are designated by trademarked and generic names.

**About ATRALOC Needles**

ATRALOC Needles are supplied in a variety of sizes, shapes and chord lengths. Surgeons should select the type of needle that, in their experience, is appropriate for the specific procedure and tissue.

Needle shapes are generally classified according to the degree of curvature of the body — 5/8, 1/2, 3/8, or 1/4

**The Major Characteristics of ATRALOC Needles are:**

- They must be made from high quality stainless steel.
- They resist bending but are processed so that they will tend to bend before breaking.
- Taper points must be sharp and contoured for easy passage into tissues.
- Cutting points or edges must be sharp and free of burrs.
- On most ATRALOC Needles, a Super-Smooth finish is provided that permits the needle to penetrate and pass through with minimal resistance or drag.

**Size**

Suture size, denoting the diameter of the material, is in accordance with the United States Pharmacopeia (USP).

**Needle Silhouette**

Needle Silhouettes are shown in ACTUAL SIZE. The designated number above the needle, within the Needle Section, is the actual length measured in millimeters.

**Code**

Product codes ending in suffix G are packaged dozen packets to a box. Product codes ending in suffix H are packaged 3 dozen to a box. Product codes ending in suffix T are packaged 2 dozen packets to a box. In the few instances where no alphabetic suffix is in the product code, the number of packets per box is identified by a footnote. The number of strands per Multi-Strand packet appears on the left of suture length.

**Needle Length**

Needle length is the actual length measured in millimeters. Needle lengths can be found within the Needle Section and throughout the catalog to the right of the needle code. As a user you will find that many of these needle lengths have been rounded off. Recognize that the needles are not changing, but for consistency ETHICON has applied a rounding convention to all needle lengths. Due to timing differences, the box and label dimensions may not match the catalog exactly, but will be updated accordingly in the near future.

circle and straight — with taper, cutting, blunt points or TAPERCUT\* Surgical Needle tips.

In general, the same size of needle may be made from finer gauge wire for use in soft or delicate tissues and from heavier gauge wire for use in tough or fibrosed tissues (the surgeon's choice).

- Ribbed needles — longitudinal ribs are provided on many ATRALOC Needles to increase the stability of the needle in the needleholder.
- The attachment of the needle to the suture material must be secure so that the needle will not separate from the suture material under normal use. An exception is the CONTROL RELEASE Needle suture principle, which facilitates fast separation of needle from suture when desirable.

### MULTIPASS\* Needles

#### Elements of Needle Design

Needle design involves analyzing a surgical procedure and the density of the tissue involved in great detail. ETHICON engineers work continuously to improve upon their needle line.

The anatomy of the ideal surgical needle has three key factors that make up the ideal needle. - Alloy - Geometry - tip and body - Coating

The combination of these attributes is ETHICON MULTIPASS Needle Technology.

MULTIPASS Needles are the highest performing needles that ETHICON Products offers; a combination [or a balance] of three proprietary technologies ensure excellent strength, tissue penetration and control; pass after pass.

**CONTROL RELEASE Needle Sutures**

- The needle is held securely in holder. Suture is grasped securely just below needle, pulling strand taut.

- The needle is released with a straight tug of the needleholder.

**Selection and Use of Needleholders**

- The needleholder must be an appropriate size instrument for the size needle selected.
- It must be made from good quality steel with a secure jaw design.

- Needles should be grasped in an area about 1/3 to 1/2 of the distance from the swaged area to the point. Avoid placement on or near the swaged area.

- The needle should be placed securely in the tip of the needleholder jaws.

- Do not damage taper points or cutting edges when using the needleholder to pull the needle out through the tissue. Grasp as far back as possible.
- When placing the needle in tissue, any force applied should be in the direction following the curve of the needle.

- Do not take excessively large bites of tissue with small needles.

- Do not force or twist the needle in an effort to bring the point out through the tissue – withdraw the needle and replace tissue.
- Do not force a dull needle through tissue – obtain a new one.
- Avoid using the needle to bridge or approximate tissues for suturing.
- If the needle is held too tightly in a sharp or hard jawed or defective needleholder, the needle may be damaged or notched in such a manner that it will have more of a tendency to bend or break on successive passes through tissue.

- When the needle holder with needle is passed to the surgeon, the needle should be pointing in the right direction in which it will start to be used without need for readjustments.
- In some patients, the tissues may be tougher or fibrosed more than normal and require the use of a heavier gauge needle.
- In deep confined area, ideal positioning of the needle may not be possible. The surgeon should proceed with caution or use a heavier gauge needle

An ATRALOC Needle is an instrument that complements the surgeon's skills. The variety of ETHICON needles offers the surgeon a choice of needles which are dependable for consistent quality and for practically all surgical applications.

## Steps to Create Performance

### Controlled Manufacturing

ETHICON makes its own needle/sutures combinations. Each step, from raw material to finished needle, is carefully controlled for uniformly superior performance.

Conventional needle

Super smooth

### Strong, Sharp Micrograin Stainless Steel

ETHICON makes its needles from premium grade stainless steel formulated specifically for surgical use.

The ETHICON process controls the orientation of the micrograins so that ductility and strength are closely controlled – for strong needles that start sharp, and stay sharp, thus assuring easy passage through tissue.

### Super-Smooth

Virtually all ATRALOC Needles have a micro-thin Super-Smooth finish that permits the needle to penetrate and pass through the toughest tissue with an almost fluid-like flow, with minimal resistance and virtually no drag, giving the surgeon a feeling of control.

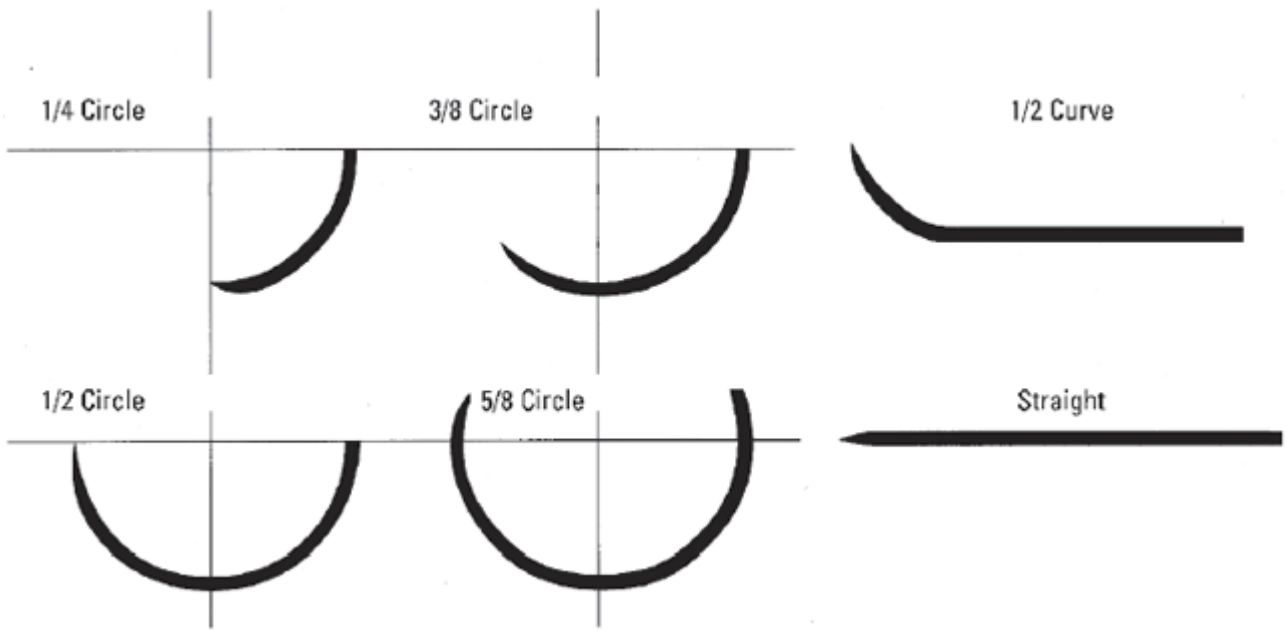

### Needle Swaging

Needles are permanently attached to the suture materials, eliminating the need for threading and providing a new, sharp needle each time. ATRALOC Needle swaging gives the surgeon a needle with an unbroken surface from end to end; without double strands, it draws through tissue easier and with less tissue trauma.

### Ribbed for Security and Control

Longitudinal ribbing on the inside and outside curvatures of most needles has a cross-locking action in the needleholder, minimizing turning, rocking or twisting and thus providing unsurpassed needle control.

Shapes

Types

**Taper Point Needle**

For soft, easily penetrated tissues.

**ETHIGUARD\* Blunt Point Needle**

Taper body. For blunt dissection and suturing friable tissue.

**Precision Cosmetic-Conventional Cutting PRIME Needle**

For delicate plastic or cosmetic surgery. Conventional cutting tip and PRIME geometry for increased sharpness.

**Conventional Cutting Needle**

Two opposing cutting edges, with a third on inside curve. Change in cross-section from a triangle cutting tip to a flattened body.

**MICRO-POINT\* Surgical Needle (Spatula)**

Thin, flat profile. Specially designed for ophthalmic anterior segment surgery.

**Reserve Cutting Needle**

Cutting edge on outer curve. For tough, difficult-to-penetrate tissues.

**Conventional Spatula Needle**

Visibility of the point at bottom provides control of depth penetration.

**TAPERCUT\* Needle**

Cutting tip, taper body. For tough tissue, like two needles in one.

**ULTIMA\* Needle (Spatula)**

Reduced edge-angles provide better penetration. Readily facilitates knot rotation in ophthalmic surgery.

**Precision Point Needle**

For delicate plastic or cosmetic surgery. Cutting tip electropolished for added sharpness.

**VISI-BLACK\* Surgical Needle**

Slim Taper point needles with a black finish for improved visibility and penetration.

### **SABRELOC\* Needle (Spatula)**

Side-cutting spatula shaped edges. For layers of scleral or corneal tissue. Spatulated needle point is centered for maximum needle stability in thin sclera. Four equidistant and properly defined edges provide greater control.

### **MICRO-POINT\* Reverse Cutting Needle**

Cutting edge on outer curve. Extremely smooth. Extremely sharp for ophthalmic surgery.
