Chapter 1.1: Atoms, Compounds and Mixtures

ñ

Introducing Little Miss 'Element' < >

Hi! I am Little Miss "Element"
I am PURE SUBSTANCE
I cannot be broken down into any simpler substance by means of a chemical reaction* or electricity!

Elements

Definition of an element:

An element is a <u>pure substance</u> which <u>cannot</u> be split up into two or more simpler substances by chemical means.

Sugar is not an element as it can be broken down into carbon and water.

Examples of elements

Elements are made up of tiny particles

Elements can be further classified into two groups:

Is the smallest particle of an element and has the same chemical properties of the element

Is made up of two or more atoms that are chemically bonded together

(note: these atoms are of the SAME element!!)

An element is made of tiny particles called **atoms**.

The atoms of an element are different from that of another element.

Elements

Note that an element:

- Consists of only one kind of atom,
- Cannot be broken down into a simpler type of matter by either physical or chemical means
- Can exist as either atoms (ex: carbon) or molecules (ex: hydrogen).

The nucleus is the massive center of the atom. It was discovered in 1911, but it took scientists another 21 years of experimenting to identify its parts.

Atoms have three parts:

- 1) Protons
- 2) Neutrons
- 3) Electrons.

Carbon Atom

Protons

n

- They are positively charged.
- Are located in the nucleus.
- In this picture, the protons are the blue pieces in the center of the atom.

Neutrons

- Neutrons are neither positive nor negative.
- Neutrons are in the nucleus of an atom.
- In this picture, neutrons are the purple pieces in the center of the atom.

Electrons

- Electrons orbit around an atom. In this picture, they are the small yellow bits.
- They have a negative charge.
- They are lighter than protons or neutrons.

Molecules

- A molecule is a group of atoms bonded together. They are the smallest unit that make up a compound.
- This is a picture of a water molecule. It is two parts hydrogen and one part oxygen.

Sugar Molecule

Very few elements exists as atoms besides elements such as helium and neon.

Most elements exist as molecules.

For example, hydrogen is H₂.

Ozone is O_3 .

Revision Questions

- What are the three parts of an atom?
- Name the charge of each part of an atom (whether it's negative or positive).
- What is a water molecule made up of?
- Name three things that you can find in your house that are made of compounds.
- Which is smaller, elements or compounds?

ñ

Chemists use symbols to represent elements.

For example, **O** represents **oxygen** while **Fe** represents **iron**.

Element	Symbol	Element	Symbol
Calcium	Са	Mercury	Hg
Carbon	С	Neon	Ne
Hydrogen	Н	Silicon	Si
Iron	Fe	Sodium	Na

Why is the Periodic Table important to me?

- The periodic table is the most useful tool to a chemist.
- You get to use it on every test.
- It organizes lots of information about all the known elements.

Pre-Periodic Table Chemistry ...

- ...was a mess!!!
- No organization of elements.
- Imagine going to a grocery store with no organization!!
- Difficult to find information.
- Chemistry didn't make sense.

Dmitri Mendeleev: Father of the Table

HOW HIS WORKED...

- Put elements in rows by increasing atomic weight.
- Put elements in columns by the way they reacted.

SOME PROBLEMS...

 He left blank spaces for what he said were undiscovered elements. (Turned out he was right!)

- Mendeleev wasn't too far off.
- Now the elements are put in rows by increasing ATOMIC NUMBER!!
- The **horizontal rows are called peri**ods and are labeled from 1 to 7.
- The **vertical columns are called groups** are labeled from 1 to 18.

◀ ▶

There are two major groups of elements – **metals** and **non-metals**.

Iron is a metal. Oxygen is a non-metal.

Metals and non-metals are grouped separately on the **Periodic Table**.

There are some elements called **metalloids** which behave like both metals and non-metals.

ñ 1 Periodic Table 18 н He hydrogen boron group 1.008 4.0026 alkali metals carbon group 14 2 13 15 16 17 1 alkaline earth metals. nitrogen group Li C N Ne Be B 0 transition metals chalcogens 6.94 10.81 9.0122 12.011 14.007 15.999 10 halogens lanthanides Na Mg P S CI Ar AI actinides noble gases 8.085 30.9738 32.06 22.9898 24.3050 26.9815 39.948 5 9 10 11 3 8 12 111 12 6 7 18 13 15 16 17 14 K Sc Cr Co Ni Cu Zn 58.9332 58.6934 63.546 65.38 Ni Ga Se Br Kr Ca Ti v Mn Fe As ue 39.0983 40.078 50.9415 51.9961 54.938 69.723 72.63 74.9216 78.96 70 904 83,798 44 9559 47 867 55.845 19 20 21 22 23 24 25 26 27 28 29 30 31 22 34 36 31 35 Rb Sr Y Zr Nb Mo Rh Pd Cd In Sn Sb Te Xe TC Ru Ag 88 9059 91 224 92.9064 95.96 107.868 112 411 114 818 118.710 121.760 127.60 85.4678 87.62 98 102.906 106.42 101.07 131 203 40 41 42 * 43 44 45. 46 47 48 49 50 54 37 38 39 58 \$1 52 W Re Pt Hg TI Pb Bi Ba Hf Та Os Ir Au Cs La Po Rn At 192.217 195.084 196.967 200.59 204.38 207.2 132,905 137,327 138,905 178,49 180,948 183,84 186,207 190,23 208.98 209 56 74 76 77 78 79 80 81 85 -86 55 57 72 73 75 82 84 88 -Db Sg Hs Fr Rf Bh Mt Uuh Ra Ac Ds Rg Cn Uut Uuq Uup Uus Uuo 262 266 223 226 227 261 264 277 268 89 3 104 3 105 3 106 3 107 3 108 3 109 3 110 3 111 3 112 3 113 3 114 3 115 3 116 3 117 🛠 118 2. 87 -88 🛪 Pr Nd Pm Sm Eu Gd Tb Dy Ho Er Tm Yb Ce Lu 150 36 151 964 157 25 158 925 162 500 164 93 167 259 168 934 173 054 174 967 140 116 140 908 144 242 145 62 60 🕰 63 64 65 66 67 58 59 61 68 69 70 71 Th Pa U Np Pu Am Cm Bk Cf Es Fm Md No Lr

Groups...Here's Where the Periodic Table Gets Useful!!

- Elements in the same group have similar chemical and physical properties!!
- (Mendeleev did that on purpose.)

Why??

- They have the same number of valence electrons.
- They will form the same kinds of ions.

Families on the Periodic Table

- Columns are also grouped into families.
- Families may be one column, or several columns put together.
- Families have names rather than numbers. (Just like your family has a common surname.)

Hydrogen

- Hydrogen belongs to a family of its own.
- Hydrogen is a diatomic, reactive gas.
- Hydrogen was involved in the explosion of the Hindenberg.
- Hydrogen is promising as an alternative fuel source for automobiles

 1st column on the periodic table (Group 1) not including hydrogen.

ñ

- Very reactive metals, always combined with something else in nature (like in salt).
- Soft enough to cut with a butter knife.
- Ex: Sodium (Na)

Group 2

Second column on the periodic table. (Group 2)

n

- Reactive metals that are always combined with non-metals in nature.
- Several of these elements are important mineral nutrients (such as Mg and Ca)

Halogens (Group 7)

n

- Very reactive, volatile, diatomic, nonmetals
- Always found combined with other elements in nature.
- Used as disinfectants and to strengthen teeth.
- Example: Chlorine (Cl)

The Noble Gases

The Noble Gases (Group 8)

- Elements in group 8
- VERY unreactive, monatomic gases
- Used in lighted 'neon' signs
- Have a full valence shell.

I am also a PURE SUBSTANCE I am made up of a fixed number of two or more elements chemically

<u>combined</u>.

Little Miss Naughty

What is a compound?

A compound is a substance which is made up of two or more elements chemically combined together.

- Chemical reactions taking place.

Water

Ammonia gas

Consists of two or more elements

And

They are chemically combined together!

Making compounds from their elements

Example: Making iron sulphide compound

I am formed <u>by atoms of different</u> <u>elements</u>. However, I do not have the same properties as them.

• Na + Cl₂
$$\rightarrow$$
 NaCl
(s) (g) (s)

• $H_2 + O_2 \rightarrow H_2O$ (g) (g) (l)

Molecules-Elements or compounds?

- A molecule consists of two or more atoms of the same element, or different elements, that are chemically bound together.
- It can be a molecule of an element
- E.g. N₂, O₂, S₈

• H₂O, CO₂, NH₃

 \mathbf{O}

Definition of a mixture:

A mixture is not a pure substance as it contains a mixture of atoms of molecules which are not chemically combined together.

Note that a mixture:

n

- Consists of <u>two or more different elements</u> and/or compounds <u>NOT chemically combined</u>.
- Can be separated into its components by physical means.
- Often has many of the properties of its component elements.

ñ

 Examples of mixtures include muddy water and air.

Air is made up of gases such as nitrogen and oxygen mixed together.

Little Mr 'Mixture'

I **do not have a fixed composition** of the substances.

A Mixture can be:

- element + element
- element + compound
- compound + compound

Mixtures can be separated into the elements that make them up by physicals methods.

A mixture of two elements, ex: neon (Ne) and hydrogen (H₂)

A mixture of lelement and l compound

A mixture of one element and one compound, ex: hydrogen (H₂) and ammonia (NH₃)

A mixture of two compounds, ex: water vapour (H₂O) and carbon dioxide (CO₂)

Conclusion

An element is a pure substance which cannot be split up into two or more simpler substances by chemical means.

A compound consist of a fixed number of different kinds of atoms chemically combined together.

A mixture is not a pure substance as it contains a mixture of atoms of molecules which are not chemically combined together.

Comparison between mixtures and compounds

	Mixture	Compound		
Separation /breakdown	Components <u>can be</u> <u>separated by physical</u> <u>methods</u>	Elements in a compound <u>Cannot be separated by</u> <u>physical methods</u>		
Properties (chemical / physical)	Same properties as its components	Properties are unique and different from its elements
