

Answer **all** the questions.

1. The graphs below show the density of two different plant species as proximity to the coast changes.

Which of the following statements correctly describes one aspect of the technique used to collect these data?

- A Quadrats were randomly placed using a random number generator and coordinates.
- B Larger quadrats were required for **species A** because their mean density was higher.
- C A belt transect has been used to allow calculation of density.
- D Abiotic factors were measured at every point of quadrat sampling.

Your answer

[1]

2. Deep sea vents on the ocean floor are surrounded by unusual organisms such as chemosynthetic bacteria and eyeless shrimp.

Which of the following statement(s) about these ecosystems is / are true?

- Statement 1:** The temperature of the vents influences the organisms that live there.  
**Statement 2:** A predatory octopus would affect the balance of these organisms.  
**Statement 3:** The number of eyeless shrimp found at each vent is constant.

- A 1, 2 and 3  
B Only 1 and 2  
C Only 2 and 3  
D Only 1

Your answer

[1]

3. This question is about ecosystems in the Southern (Antarctic) Ocean.

Observe the food chain:

phytoplankton (producers) → krill (shrimps etc.) → small fish → large fish → seals

**Table 21.1** shows the transfers of energy and the quantities of energy stored as biomasses for the food chain. Magnitudes are given in kilojoules per square metre of sea surface per year.

	Phyto-plankton	Krill	Small fish	Large fish	Seals
<b>Energy input, by photosynthesis or feeding</b> (kJ m <sup>-2</sup> y <sup>-1</sup> )	900	80	11	1.4	
<b>Energy lost to surroundings by respiration</b> (kJ m <sup>-2</sup> y <sup>-1</sup> )	180	64	8.8	1.2	1.05
<b>Energy input converted to biomass</b> (kJ m <sup>-2</sup> y <sup>-1</sup> )	720	16	2.2	0.2	0.05
<b>Biomass energy lost to other consumers or decomposers</b> (kJ m <sup>-2</sup> y <sup>-1</sup> )	640	5	0.8	0.09	0.05

**Table 21.1**

- (i) For larger and less numerous organisms, such as the seal, it is more appropriate to record energy flows per square kilometre.

Calculate the energy input to the seal population from large fish. Record your answer in kilojoules per square **kilometre** of sea surface per year.

**Answer**\_\_\_\_\_ **[2]**

- (ii) Calculate the percentage of energy stored in large fish biomass converted to energy in seal biomass. Show your working.

**Answer**\_\_\_\_\_ **[2]**

- 4(a). A small, permanent pond is the habitat for a climax community of producers (aquatic plants and algae) and consumers (bacteria, protocista, worms, snails, arthropods and small vertebrates like newts and fish).

Why might ecologists call this a 'climax community'?

[1]

- (b). The protoctist *Paramecium caudatum* is usually between 200 and 300  $\mu\text{m}$  in length. An accurate measurement would help in the correct identification of a specimen from this pond.

What laboratory equipment would you select to make an accurate measurement of the length of *Paramecium caudatum*?

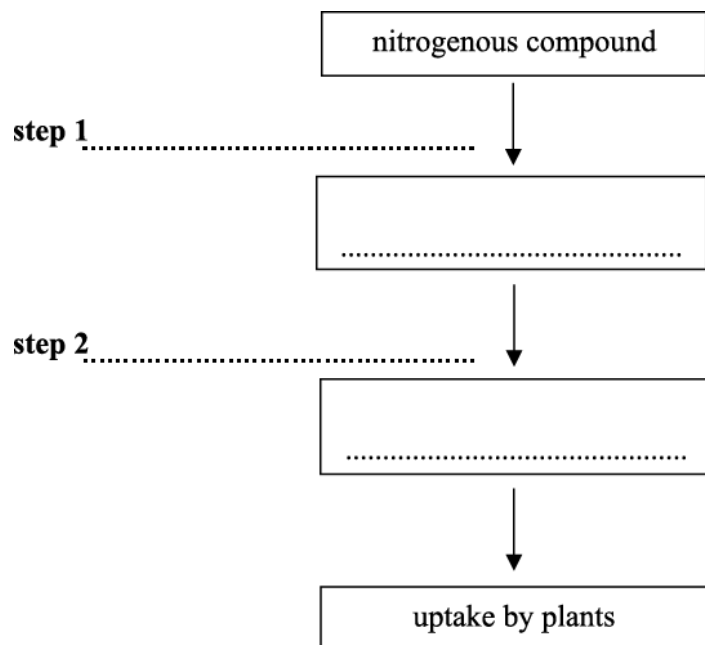

**[2]**

- (c). An animal fell into the pond. It drowned and decayed. Within a year the biological compounds in its body had been completely recycled.

- (i) What nitrogenous excretory molecule from the decomposers would pass to the next stage of the nitrogen cycle?

[1]

- (ii) Complete the flow chart to show what happens to this nitrogenous compound, and name the groups of bacteria involved at steps 1 and 2, as it is converted to a form that plants can take up and use.

[4]

[illegible]

(b). State **two** developments, other than selective breeding, that could account for the total increase in wheat yield per hectare.

---

---

**[2]**

6(a). The elk, *Cervus canadensis*, is a large herbivore.

Fig. 2.1, shows figures relating to the number of elk in Yellowstone National Park in the USA between 1965 and 2002.

Fig. 2.1

The figures were obtained in two different ways:

- the white bars show estimated numbers of live elk obtained by ecological sampling
- the black bars show numbers of elk that were legally shot by hunters.

In some years no data for live elk were obtained.

- (i) Using Fig. 2.1, describe the pattern shown by the data for the estimated number of live elk from 1965 to 2002.

-----

-----  
-----  
-----  
-----  
-----  
-----  
-----

[3]

(ii) The recorded number of elk legally shot by hunters provides accurate data.

Suggest why these data are accurate, but the method used to obtain these data is not a valid way of estimating the number of elk in the population.

-----  
-----

(b). The grey wolf, *Canis lupus*, is a large predator whose diet includes elk.

By 1926, grey wolves had been hunted to extinction in Yellowstone Park. However, this species could still be found in other parts of the world.

In 1995, a population of grey wolves was introduced to Yellowstone Park and their numbers increased.

(i) With reference to Fig. 2.1, discuss the factors that may have affected the size of the elk population:

- before 1995
- after 1995.

*In your answer you should provide a balanced account referring to factors before and after 1995.*

-----

- Outline how the **percentage efficiency** of energy transfer between producers and herbivores can be estimated.

Outline how the **percentage efficiency** of energy transfer between producers and herbivores can be estimated.

© OCR 2018. You may photocopy this page.

- (b). One way that humans try to maximise food production is to manipulate the transfer of energy through ecosystems.

A number of methods can be used to increase energy transfer through agricultural ecosystems and other food production systems.

These methods include:

- A        artificial selection
- B        recombinant DNA technology
- C        growing microorganisms in a fermenter
- D        use of immobilised enzymes
- E        control of plant physiology with synthetic plant hormones
- F        manipulation of the nitrogen cycle.

Using the letters **A – F**, select the **most suitable** method that could be used to achieve each of the aims shown in the table below.

You may select each letter more than once.

Aim	Letter
improving soil that is low in nutrients for the growing of wheat	
preventing the spoilage of fruits after picking	
reducing the impact of a fungal disease on yields from cucumber plants	
producing strawberry plants that grow quicker and fruit earlier	
making sugar syrup from waste starch	
producing large amounts of a fungus for food	

[6]

8(a). Describe the differences between the following biological terms:

a pioneer community and a climax community

9. The list below describes some types of plant found during primary succession on a sand dune.

- i. a legume that contains nitrogen fixing bacteria
- ii. hardy grasses that can resist desiccation
- iii. large mature trees
- iv. small herbs that can tolerate salty spray
- v. small trees and bushes

In which order are these plants most likely to grow successfully?

- A**        i – ii – iii – iv – v
- B**        ii – v – iv – i – iii
- C**        ii – iv – i – v – iii
- D**        ii – iv – iii – v – i

Your answer

### Mark Scheme

Question			Answer/Indicative content	Marks	Guidance
5	a		<p>1 crossbreed / breed / interbreed, high-yielding, wheat plants / individuals;</p> <p>2 <u>assess / test / measure</u>, yield / AW;</p> <p>3 crossbreed / AW, selected / best / high-yielding, offspring;</p> <p>4 over generations</p> <p>5 marker assisted selection / prevent self-pollination / genetic screening / prevent unwanted (cross) pollination;</p>	4 max	<p><b>1 ACCEPT</b> breed high-yielding individuals  <b>1 ACCEPT</b> 'mate / reproduce' as AW for 'breed'  <b>1 IGNORE</b> inbreed  <b>1 ACCEPT</b> description of high-yielding plant, e.g. more, ears / grain / seed / wheat  <b>1 ACCEPT</b> if only one of the plants is high-yielding</p> <p><b>2 IGNORE</b> select the best offspring</p> <p><b>4 ACCEPT</b> several / a few generations  <b>4 IGNORE</b> time</p> <p><b>5 ACCEPT</b> descriptions  <b>5 IGNORE</b> the ones with the correct gene  <b>5 ACCEPT</b> prevent self-fertilization</p> <p><b>Examiner's Comments</b></p> <p>The topic of selective breeding is frequently tested as it falls within two separate learning outcomes. Despite this, or perhaps because of this, many candidates gave a generic answer, gaining two or three marks but rarely four. Only candidates who related their answers to the example in the question gained full marks. A number of candidates failed to appreciate 'high yield' as the desired characteristic. Some just referred to 'tall plants' or, resistance to disease. References to measuring yield in the offspring or further detail relating to plant breeding were rarely seen. Some candidates seemed unaware that plants are able to carry out sexual reproduction and responses from such candidates were limited to one mark for a reference to many generations.</p>

### Mark Scheme

Question			Answer/Indicative content	Marks	Guidance
	b		<p>(use of) fertiliser;</p> <p>(use of) pesticide / fungicide / insecticide;</p> <p>improved technology;</p>	2 max	<p><b>IGNORE</b> prompt lines and mark as prose <b>IGNORE</b> refs to climate change</p> <p><b>IGNORE</b> crop rotation <b>IGNORE</b> increase in soil minerals <b>IGNORE</b> irrigation</p> <p><b>ACCEPT</b> selective herbicide <b>IGNORE</b> decrease in pests</p> <p><b>ACCEPT</b> e.g. better harvesting technology <b>IGNORE</b> genetic modification / irrigation</p> <p><b>Examiner's Comments</b></p> <p>It was pleasing to see many candidates gaining both marks. Of those that didn't it was commonly for making vague references to 'better farming' or 'more soil minerals'. Many cited GM technology, not appreciating that it's development was too recent or that such crops are currently banned in the UK.</p>
			<b>Total</b>	<b>6</b>	

### Mark Scheme

Question			Answer/Indicative content	Marks	Guidance
6	a	i	<p><b>1</b> peak in, 1988 / 1994;</p> <p><b>2</b> trend decrease after 1994;</p> <p><b>3</b> ref. decrease and then increase, 1988 to 1994;</p> <p><b>4</b> fluctuations (within pattern);</p> <p><b>5</b> overall increase from 1965 to 2002;</p>	3 max	<p><b>IGNORE</b> ref to population figures</p> <p><b>1 ACCEPT</b> increases until / highest number in, 1988/1994</p> <p><b>4 ACCEPT</b> 'goes up and down' / oscillates</p> <p><b>Examiner's Comments</b></p> <p>This question was generally well answered. The majority of candidates were able to identify either or both of the peaks in 1988 and 1994 and some went onto mention the decrease and increase in population between these dates, finishing with the decrease after 1994. It was encouraging to see general statements about the fluctuations in the data and the overall increase from 1965 to 2002. Common errors were to describe trends from 1965 to 1988 or comment on the numbers of shot elk. Other mistakes made were misreading the data or not mentioning any dates at all.</p>

## Mark Scheme

Question			Answer/Indicative content	Marks	Guidance
		ii	<p><i>accurate because</i></p> <p><i>idea that</i> actual number of elk shot is recorded;</p> <p><i>method not valid because idea that</i> number of elk shot / hunting success, varies independently of population size;</p>	2	<p><b>ACCEPT</b> elks shot are counted / reported</p> <p><b>CREDIT</b> suitable reason  e.g. numbers of licences issued / number of hunters  set quotas to hunt  illegal hunting  if weather suitable for hunting  only younger / older / diseased / larger, elk killed</p> <p><b>IGNORE</b> length of time spent hunting</p> <p><b>Examiner's Comments</b></p> <p>Most candidates got the first marking point and understood that the number of elk shot would be recorded and was therefore accurate. However, fewer candidates gained the second marking point about why the method was not valid. The candidates who did get it tended to talk about illegal hunting making the data less valid, as opposed to hunting success being independent of overall population size. A common mistake was to talk about hunting scaring off elk from the area or elk dying from factors other than hunting. Some candidates also confused their answers by talking about ecological sampling in general and not relating it to the question asked.</p>

### Mark Scheme

Question			Answer/Indicative content	Marks	Guidance
	b	i	<p><b>1</b> <i>idea that population size is determined by <u>limiting factor(s)</u>;</i></p> <p><i>Before 1995, population increases due to</i>  <b>2</b> example of factor that is not limiting population;</p> <p><i>Before 1995, population levels off because</i>  <b>3</b> reaches <u>carrying capacity</u>;</p> <p><i>Before 1995, population becomes limited by</i>  <b>4</b> intraspecific competition for named resource;</p> <p><b>5</b> interspecific competition for named resource;</p> <p><i>Population can decline at any time/ dips, due to</i>  <b>6</b> severe weather / natural disaster;</p> <p><b>7</b> decrease before 1995 not due to wolves (as none present);</p> <p><b>8</b> decrease after 1995 (probably) due to wolves;</p> <p><b>9</b> <i>idea that</i> effect of wolves on population may be debatable;</p>	6 max	<p><b>IGNORE</b> ref to abiotic / biotic factors throughout</p> <p><b>2</b> e.g. plenty of, enough, food  Less / no predation  Less / no overcrowding/ enough space  less hunting  <b>2 IGNORE</b> water / nutrients / availability of food</p> <p><b>4 CREDIT</b> description of intraspecific</p> <p><b>5 CREDIT</b> description of interspecific</p> <p><b>4 &amp; 5 CREDIT</b> any suitable limiting factor  eg competition for, food / space / mates / overcrowding</p> <p><b>6 CREDIT</b> ref to parasites / disease / drought / floods / fires</p> <p><b>9</b> e.g. lack of data in 1996 and 1997 makes it difficult to form conclusions</p>

# Mark Scheme

Question			Answer/Indicative content	Marks	Guidance
		i	QWC;	1	<p><b>Award if</b>  <b>1 mark</b> awarded from <b>mps 1 to 6 (limiting factors)</b>  <b>and</b>  <b>1 mark</b> awarded from <b>mps 7 to 9 (effect of wolves)</b></p> <p><b>Examiner's Comments</b></p> <p>Most students used additional sheets for this question but very few gained additional marks for their extra effort. Mostly they continued with lengthy descriptions and explanations of predator-prey relationships and gained no marks for that.</p> <p>Those candidates who recognised the need to explain the population growth curve and did so in a logical sequence, setting out a section for before 1995 and one for after 1995, gained the most marks for this question. Very few candidates recognised that limiting factors were involved.</p> <p>A good number of candidates recognised that the population increase was due to an abundance of food, enough space, enough mates or less predation or less hunting. Some candidates didn't mention the population at all or mentioned the size of the elk, and not the elk population. General references to population being affected wouldn't gain marks here as it was specifically for a reason linking it to an increase in population.</p> <p>A minority of candidates mentioned the carrying capacity being reached before 1995 but sometimes it was not always awarded due to it being referred to after 1995.</p> <p>When candidates used the proper terms of intraspecific and interspecific competition or described them correctly they often missed the marks by not giving a <b>named</b> resource or linking it with population size, rather than a named resource.</p> <p>Many candidates gained the mark for</p>

## Mark Scheme

Question			Answer/Indicative content	Marks	Guidance
					<p>disease affecting population size but sometimes didn't link it with a decrease or dip in population size.</p> <p>The link that any decrease before 1995 was not due to the wolves as none were present was rarely awarded, but the majority of candidates mentioned that after 1995 there was a decrease in elk population and it was likely due to the wolves. This often triggered the QWC mark being awarded. Very occasionally candidates mentioned the idea that the effect of wolves on population may be debatable.</p> <p>There were a number of candidates who wrote about Elm trees or Elk trees and not Elk. In some cases, candidates went into detail of photosynthesis and mineral ions in the soil, showing a complete misunderstanding of the question asked, and relating it to a question asked about Elm trees in a previous paper.</p>

### Mark Scheme

Question			Answer/Indicative content	Marks	Guidance
		ii	<p><i>re-introduction of wolves is conservation because</i></p> <p>1 restoring the <u>ecosystem</u> (to its original form)  <b>or</b>  maintains <u>biodiversity</u>;</p> <p>2 helps the (global) wolf population;</p> <p>3 active / dynamic / sustainable, management / maintenance;</p> <p>4 prevents over-population by the elk;</p> <p>5 prevents over-grazing  <b>or</b>  damage to, habitat / ecosystem;</p>	2 max	<p><b>ACCEPT</b> controls/ increases, <u>biodiversity</u></p> <p><b>ACCEPT</b> wolves do not become extinct / increase in number</p> <p>‘Actively maintains biodiversity’ = <b>MP1 and 3</b></p> <p><b>ACCEPT</b> wolves, limit / control, elk population or lack of wolves causes elk population to grow</p> <p><b>ACCEPT</b> if wolves absent, elk would damage habitat / other species may become extinct</p> <p><b>Examiner's Comments</b></p> <p>This was generally a well answered question with references to maintaining or increasing biodiversity and the idea of conserving the wolf as a species, gaining two marks. Only a few answers included reference to biological control of the elk population, which if uncontrolled would result in damage to the ecosystem by overgrazing. A lack of key terms (ecosystem / management / maintenance) stopped some candidates from getting both marks and several candidates used the word 'conservation' in their answer, despite it being in the stem of the question.</p> <p>Common mistakes were to focus the whole answer on just increasing biodiversity or helping the wolf population, without making a second point for the other mark, or to give a general definition of conservation without relating it to the question asked.</p>
