Stroke Exercises For Your Body

Stroke rehabilitation in America leaves much to be desired in terms of recovery and quality of life. There is a serious gap between stroke patients being discharged and transitioned to physical recovery programs. In an effort to improve recovery and quality of life, the American Heart Association has urged the healthcare community to [prioritize exercise as an essential part of post-stroke care](#).

With the right recovery programs that prioritize exercise for rehabilitation, stroke survivors can “relearn” crucial motor skills to regain a higher quality of life. Thanks to a phenomenon known as [neuroplasticity](#), even permanent brain damage doesn’t make disability inevitable.

“There is strong evidence that physical activity and exercise after stroke can improve cardiovascular fitness, walking ability, and upper arm strength. In addition, emerging research suggests exercise may improve depressive symptoms, cognitive function, memory, and quality of life after stroke.”

- **Sandra Billinger, Physical Therapist at the University of Kansas Medical Center**

How Your Brain Recovers From a Stroke

Recovery after a stroke is possible because the human brain is capable of reorganizing and retraining itself through neuroplasticity.

When you perform repetitive physical tasks, you tap into this ability by retraining unaffected parts of your brain to perform functions that your damaged brain cells once performed. In simple terms, neuroplasticity is the process of “rewiring” the brain to perform tasks through different neural pathways.

Some “spontaneous” recovery does occur after a stroke, but it doesn’t continue forever. According to a study published in the Journal of the American Physical Therapy Association, [spontaneous motor recovery](#) only occurs during the first 6 months of recovery. Afterwards, rehabilitation is necessary to make further progress, especially if you need to learn new skills and coping mechanisms.

To overcome the leading cause of disability, **a consistent exercise program is critical**. By using the power of neuroplasticity, stroke survivors can regain mobility and function. If you want to overcome the limitations of traditional recovery methods, you should know that exercise is your most effective tool.

Benefits of Exercise After a Stroke

Exercise increases your chances of regaining function after a stroke. In fact, when stroke survivors have trouble performing daily functions, it isn't always because of the stroke itself. Brain damage also causes problems that indirectly lead to loss of physical function. After suffering a stroke, survivors who don't begin an exercise regimen will experience additional, preventable problems such as physical deconditioning and fatigue.

They may also face a variety of obstacles that make it more difficult to begin exercising, such as:

- Lack of social support
- Financial instability
- Depression
- Severity of physical symptoms
- Fatigue
- Frustration
- Confusion
- Lack of motivation

These barriers are precisely why a tailored, consistent exercise regimen is such an important part of proper post-stroke care. When patients receive support, tools, and specific instructions to keep them active after a stroke, obstacles such as fatigue and depression will get smaller and less powerful, making it easier to continue a regimen of aerobic and strength-training exercises.

These exercises, in turn, give patients the power to reclaim lost abilities and get back to the life they had before the stroke.

According to the American Heart Association, [exercising after a stroke](#) is a crucial way to improve the following:

- Cardiovascular fitness
- Walking ability
- Muscle strength
- Flexibility
- Coordination
- Cognitive function
- Mental health
- Memory
- Quality of life

Exercises for Stroke Recovery

Any amount of physical activity is a positive step for stroke survivors. Over time, even light activity such as walking around the block or doing laundry will contribute to physical improvements and help prevent the deconditioning that leads to further deterioration. However, activities of moderate intensity are even more beneficial for your health. If you want to reclaim a specific function, for example, you can incorporate a variety of at-home exercises to target individual body parts.

Remember, a full recovery is only possible if you take direct action to reclaim function in the months and years that follow. By following an exercise program that targets specific areas and functions, you can reclaim your coordination, strength, and range of motion throughout your body.

Each of the following exercises is designed to condition your body and brain in specific ways. The movements are recommended by trusted physical therapy professionals and cover the following areas of the body: shoulders, arms, balance, hands, legs, and core. Follow along with helpful illustrations as you work through the basic, intermediate, and advanced versions of these post-stroke exercises.

As with any exercise program, please consult your healthcare provider before you begin. If you notice increased pain, discomfort, or other troubling systems, stop these exercises immediately and talk to your doctor.

Arm Exercises

A stroke can often make it difficult to perform simple tasks like moving the arm forward or grasping and releasing objects. Physiotherapist Simbarashe Shawe recommends eight simple exercises to help [restore strength and function in the arms of stroke survivors](#).

Basic Arm Exercises

Strokes are a frightening, life-threatening medical condition, but once you begin recovering you will experience the impact on your quality of life caused by neurological damage. It's possible to retrain the brain to make up for this damage, but you must keep the affected muscle groups active. These basic level exercises are a starting point to add flexibility and mobility to your affected arm after a stroke.

1

Inner Arm Stretch

For this exercise, place your hands palms down on the table and rotate your wrist so your fingers point towards your body. Keeping your elbows straight, slowly move your body backwards until you feel a stretch on the inside of the arm. Lean on the table for support if you need to.

2

Wrist and Hand Stretch

For this exercise, place your forearm on the table, with the hand over the edge of the table, palm down. First, drop the hand down, using your other hand to gently stretch the ligaments and muscles. Then, leaving your forearm on the table, lift the wrist up, down and sideways, gently stretching the extended wrist with the other hand.

Intermediate Arm Exercises

Once you have gained basic flexibility in the wrist, hand, and inner arm, you are ready to work on a full range of motion for these joints. These intermediate-level exercises, which work well in conjunction with [SaeboMAS](#) and [SaeboReach](#), can be the key to recovering the use of your arms. They help retrain the brain to make up for the neurological damage you have suffered.

1

Elbow Stretch

The elbow stretch focuses on restoring a range of motion to the elbow. This exercise can be done while sitting or standing. Hold the arm at a comfortable position, then carefully bend and straighten the elbows as if you are doing a dumbbell curl.

2

Crawling Stretch

Take up a crawling position with your elbows straight. Gently lean your body backwards, keeping your arm position, until you feel a stretch on your inner arm. Hold the position and repeat.

3

Wrist Motion

When you are sitting or standing, extend the elbow and rotate your wrist through a full range of motion. Continue this exercise a few times to encourage greater motion in the wrist.

Advanced Arm Exercises

Muscles damaged due to a stroke are often weakened, mainly due to inactivity. This is why at-home exercise is so important. Once you have regained range of motion in your arm and wrist, you are ready to begin strengthening the muscles with these advanced exercises.

1

Elbow Weight Training

In a standing or sitting position, hold a small weight in your hand. Gently bend and straighten the elbow. Repeat to your endurance point. Over time, increase repetitions as the elbow strengthens.

2

Finger Walk

Stand facing a wall or a door. Place your fingers gently on the surface of the door or wall. Walk your fingers up the surface using a spider-like motion, then walk them back down.

3

Seated Push Up

Finally, sit on the ground with your knees bent and your palms on the floor, keeping your fingers pointing forward. Push through your hands to cause your bottom to lift off the floor slightly. Repeat as you grow stronger.

Balance Exercises

Struggling to walk or stumbling frequently is a common problem for stroke survivors, as the neurological components of balance have been damaged. Fortunately, balance is an ability that can be relearned after a stroke through therapy, rehabilitative products, and at-home exercises. Physiotherapists Beth Thornton and Kathryn Smyth suggest nine exercises to help [regain stability and balance.](#)

Basic Balance Exercises

Basic level exercises for balance may seem simple at first, but they require strong neural connections to successfully complete. Start with these simple exercises as you work to rewire your mental processes. The repeated actions will build mental connections that can help restore balance. Remember, for these basic level exercises, always hold onto something to ensure you do not fall.

1

Heel Raises (Holding On)

3 sets of 10

Find a sturdy chair or countertop you can hold on to for support. Hold on to the chair or counter, and raise yourself up onto your tiptoes, keeping your knees straight and holding your upper body tall. Lower yourself back to the floor slowly, and repeat.

2

Side Stepping (Holding On)

3 sets of 10 (1 rep = both feet)

Use a counter or ledge to hold on to, or ask someone to give you a hand to hold for balance. Place tape on the floor in a straight line. Step sideways to cross the line, crossing one leg across the front of the other leg. Reverse the motion to return to the starting point, this time crossing a leg behind.

Intermediate Balance Exercises

The intermediate level exercises use the same basic ideas as the basic exercises, but without something to hold onto. After practicing the basic level exercises for a while, you should be able to perform them without assistance. However, for safety, always have a counter or chair nearby to grab if you start to lose your balance.

1

Heel Raises (Not Holding On)

3 sets of 10

Stand with your feet flat on the floor and your arms at your sides. Raise yourself to tiptoe, keeping your upper body and knees straight. Slowly lower and repeat.

2

Side Stepping (Not Holding On)

3 sets of 10 (1 rep = both feet)

Perform the side step, crossing your legs across each other as you move sideways across a straight line, but without holding on. Go slowly to avoid a fall, and be ready to grab a hold of something if you lose your balance.

3

Heel-to-Toe Walking

20 steps (10 for each foot)

Using the straight tape line for side stepping, walk forward, placing the heel of your foot directly in front of the toe of your other foot as you walk. Continue to the end of the tape, turn, and repeat by returning to the starting point.

4

Squats Against Gym Ball

3 sets of 10

Place an exercise ball between your back and a wall, standing tall. Slowly lower into a squatting position, holding on with one hand if needed or not holding on at all. Roll back up to a standing position and repeat.

Advanced Balance Exercises

Once you start noticing improved balance, do not stop exercising. You are still building those connections. Now it's time to move on to advanced level exercises.

1

Single Leg Standing

3 sets of 5

Place both feet flat on the floor. Slowly lift one leg until you are balanced on the other leg. Hold for a count of 10, and slowly lower it back down. Alternate legs and repeat.

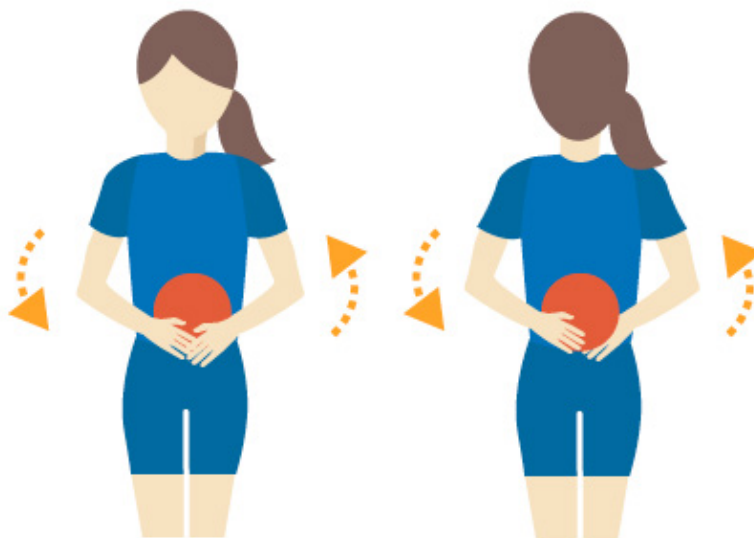

2

Backwards Walking

20 steps

In a room that is free from obstacles, walk backwards slowly. Try to avoid looking where you are going, but use your sense of balance and slow movements to avoid a fall. At first, perform this exercise with something close by to hold onto like a wall or countertop until you gain confidence in your abilities.

Weighted Ball Pass

3 sets of 10

Using a weighted exercise ball, slowly pass the ball from hand to hand as you circle it around your body. Start by circling the body in a clockwise motion. Then, repeat in a counterclockwise motion. Perform this exercise while standing.

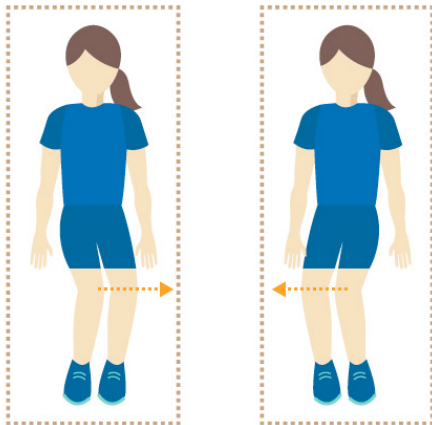

Core Exercises

While the focus of stroke recovery is often on the limbs and facial muscles, without a strong core, the rest of the body may suffer. By isolating and activating core muscles with nine exercises selected by Thornton and Smyth, stroke survivors can work to [regain coordination and strength](#) that benefits their whole body.

Basic Core Exercises

Strokes are life-threatening events that can cause irreversible neurological damage, so the recovery period is as much about retraining the brain as it is about strengthening the muscles. In order to regain use of your core muscles, you must keep them active in order to create the brain connections you need to improve after a stroke.

1

Knee Rolling

Repeat 10-20 times

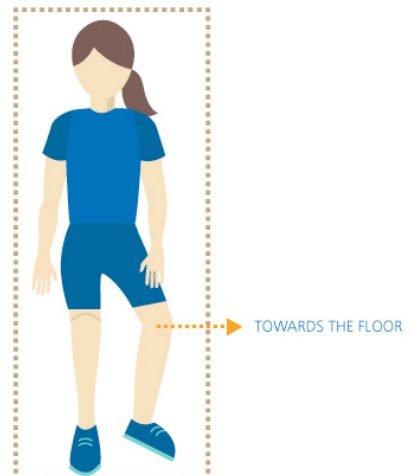

Lie on your back with your hands resting at your side. Bend your knees and place your feet flat on the floor. Roll your hips so that your knees push to the left, then to the right, then back to center.

2

Single Leg Drop-Outs

Repeat 5 times per side

Lie on the floor with the hips and feet flat with the knees bent. Keep the pelvis still, using the hands to keep it in place if needed. Inhale, and drop the left knee to the left, as far as possible without lifting the pelvis, keeping the knee bent. Exhale, and draw the knee back in.

3

Pelvic Floor Contractions

Repeat the exercise 10 times

Pelvic floor contractions, also known as Kegels, can help strengthen the muscles on the pelvic floor, which is the muscular base of the abdomen attached to the pelvis. First, find the muscles by imagining that you are trying to hold urine or stop from passing gas. Squeeze these muscles by lifting and drawing in, then hold for a count of three. Relax then repeat, gradually increasing the holding time until you can hold for 10 seconds. If at any point you feel the contraction relaxing, let it relax completely and rest for 10 seconds before contracting again.

Intermediate Core Exercises

Once you begin building some strength, you are ready to progress in your exercise practice. These intermediate exercises will challenge a larger number of core muscles and build even more strength.

1

Single Leg Bridging

Repeat for 10 repetitions, then switch legs

Lie on the exercise mat and place one leg flat on the floor with the knee bent. Place the other leg on an exercise ball. Using the core muscles, lift the pelvis off the mat and slowly lower back down.

2

Side Lying Clams

Repeat 5-10 times on each side

Clams are a great exercise for your core as well as your legs. Lie down on your side with your knees bent, resting one knee on top of the other. Keeping your feet together, lift the upper knee towards the ceiling and hold your knees apart for 10 seconds. Next, slowly lower your knee back down. Be careful not to roll your hips back.

Four-Point Kneeling

Repeat for 2-3 sets of 10 reps each

Kneel on the ground and place your hands flat on the ground so you are in a crawling stance. Contract the pelvic floor and raise one leg while lifting the opposite arm. Hold for a few seconds, and return to the starting position, repeating with the opposite arm and leg.

Advanced Core Exercises

As you continue to develop your core muscles, you will be ready to add more intensity. These advanced exercises increase the intensity of the intermediate exercises so you can regain a strong, healthy core.

1

Bridging with Arms Above Head

10-15 times

Lie on the floor or an exercise mat with your shoulders and lower back flat on the floor. Support your legs on an exercise ball. Lift your arms above your head, then use the core muscles to lift your hips off the floor until your body is in a straight line from heels to shoulders. Slowly lower back down and repeat.

2

Bilateral Leg Cycling

Rest and repeat 10 times

Lie on the floor and lift the legs off of the ground, holding them in a cycling position. Then, cycle as if you are riding a bicycle in the air.

3

Superman Pose

Repeat 10 times.

Imagine superman flying through the air. Now, lay on the floor on your stomach and take this same position, arms and legs extended. Hold to strengthen the core muscles in your back, and relax. Hold the position for 2-5 seconds and repeat 10 times.

Hand Exercises

When stroke survivors lose function and dexterity in the hands, simple daily tasks can seem like insurmountable obstacles. Sarah Lyon, occupational therapist, advocates three simple, at-home exercises to help stroke survivors [regain the use of their hands](#).

Basic Hand Exercise

A stroke often affects the ability of the brain to communicate with other areas of the body. While some of the neurological damage to the brain after a stroke is irreversible, it's possible to retrain some parts of the brain to take over the movements and activities once controlled in the damaged section.

If you are struggling to move your hands, start with this basic-level exercise, aimed at helping your brain re-learn how to control the most basic hand movements. If you are struggling to make a fist and release it, the [SaeboGlove](#) and [SaeboFlex](#) can help with positioning and re-opening as you build up control with this simple exercise.

1

1

Make a Fist

To begin retraining your brain and hands, make a fist by wrapping your thumb over your fingers. Then, slowly open and spread your fingers wide.

2

How wide you spread your fingers and how long you hold the stretch will depend on your goal. If you need to stretch the hand and increase range of motion, slowly make a fist and open it until you feel a stretch, but no pain. Repeat this slow and steady movement 10 times per session.

If you have decent range of motion, but need to improve strength, open and close your fist repeatedly and steadily for 30 seconds. Then give your body the chance to rest, and repeat the movement for an additional 30 seconds.

Intermediate Hand Exercise

If you've mastered making and releasing a fist and feel that some strength is returning to your hand, then you are ready to move towards building the range of motion of the fingers themselves. This intermediate level exercise helps achieve that goal.

1

Five Finger Spread

For this exercise, place your hand in front of you with the fingers straight and held close to one another. Carefully and gently spread them apart. When you are done with the movement, your hand will look like you just counted the number five on your fingers, with all of the fingers spaced apart from one another. Then, bring the fingers back together, and repeat the action slowly 10 times.

This exercise is called abduction and adduction. It helps the hand re-learn how to move the fingers. It also builds strength and flexibility in the hand. As you perform this exercise, remember that the goal is to practice slow, steady and controlled movement. Do not try to rush through the exercise.

Advanced Level Hand Exercise

Once you can successfully make and open a fist and spread your fingers from side to side, you are ready to try Lyon's third and final exercise: Tip to Tip. This advanced exercise focuses on adding dexterity to the strength and flexibility you have already mastered.

1

1

Tip to Tip

Start this exercise with your hands in an upright position. Spread your fingers comfortably, not the point that you feel a stretch, but just comfortably apart.

2

Once you are in position, carefully bring the tip of your thumb to the tip of your pointer finger. Your hand should look like you are making the "OK" sign. Release this, and open the hand wide. Now, repeat the movement, but touching the middle, ring and pinky fingers respectively. Repeat a total of five times.

Leg Exercises

Difficulties standing and walking after a stroke can be related to balance problems, but leg strength and mobility are also contributing factors. Richard Sealy recommends a series of low-impact strength and stretching exercises to help [regain muscle in the legs](#) and improve range of motion during stroke recovery.

Exercise #1 – Standing and Balance

Balance and coordination are often lost after a stroke. This can make simple actions, like standing and walking, difficult. In addition, weakness can occur around the muscles on the exterior of the hip area.

Exercises for standing and balance are vital to helping you regain your quality of life after a stroke. When performing these exercises, always hold on to a table or similar stable surface to avoid a fall.

1

Basic Level Standing and Balance Exercise

Repeat 10 times

Hold onto a stable surface, standing straight and tall while you transfer your weight to one side. Swing the other leg to the side. Use your balance to hold this position for 10 seconds. Slowly lower your leg back down. Repeat 10 times, as long as you have the strength, and then switch legs.

2

Intermediate Standing and Balance Exercises

Repeat 10 times

Once you have mastered the first exercise, move on to the intermediate level. Again, hold on to a stable surface, keeping your back tall and straight. Transfer your weight to one leg, and bring the other leg up in front of you, bending the knee. Hold this position for a count of 10, and slowly lower it back down. Repeat 10 times, then switch legs.

3

Advanced Standing and Balance Exercises

Repeat 10 times

Finally, progress to the advanced level. You may hold on to something for support. This time, stand straight and tall and transfer your weight to one leg. Swing the other leg out behind you as far as you can. Hold for 10 seconds, if you can, and lower it back down slowly. Repeat 10 times and switch legs.

This progression of exercises will strengthen the hip muscles and improve balance, so you can regain normal use of your legs. This exercise series pairs well with the [Saebo MyoTrac Infiniti](#) biofeedback triggered stimulation system.

Exercise #2 – Bridging

Often after a stroke, the hips and the core muscle groups, which are crucial to standing and walking, become weak. Bridging exercises help to strengthen these core muscles. Like the standing and balance exercises, bridging exercises move through a progression to help rebuild your strength and coordination.

1

Basic Bridging Exercise

Repeat 10 times

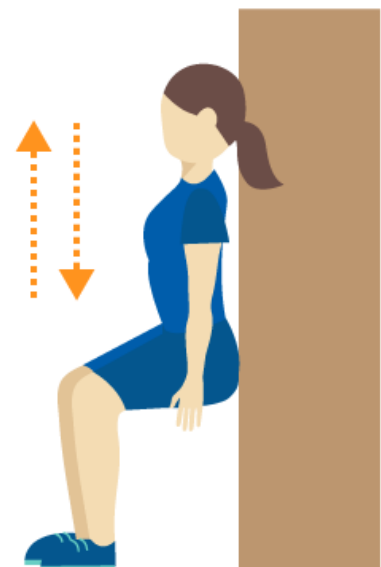

The basic bridging exercise, called “Inner Range Quad Movement”, builds strength in the thigh muscles. To perform this exercise, lie down and place a pillow or rolled towel under the knee joint. Then, press the back of the knee into the pillow or rolled towel to lift your heel off the floor.

2

Intermediate Bridging Exercise

Repeat 5-10 times

“Ski Squats” take bridging exercises to the next level. For this exercise, lean against a flat wall, placing your feet in front of you. Using the wall to support your weight and your back, slowly bend your knees to lower yourself down. Hold this position for 10 seconds, if you can. Slide back up, supporting your weight on the wall, until you are in a standing position.

3

Advanced Bridging Exercise

To take bridging exercises to the advanced level, repeat the “Ski Squat”, but place a gym ball between yourself and the wall when you bend your knees into the squat position.

Exercise #3 – Clams

If the lower legs are affected after a stroke, Clams can provide strengthening and improved range of motion. Clams focus on building strength and coordination in the lower leg, increasing range of motion and control.

1

Basic Clams Exercise – In Sitting

Before starting Clams, you must stretch the calf muscle and build coordination in the lower body. In a sitting position, create a stirrup around one foot using a towel, belt or exercise band, and place the stirrup around the ball of the foot. Gently pull the stirrup up towards your body to stretch the calf muscle. Then, pull it with the outer hand to turn the foot out, continuing to stretch the muscle.

2

Intermediate Clams Exercise

Repeat 5-10 times

Once you have gained some flexibility, you are ready for the Clams exercise. Lie down on your side, and bend your knees, resting one on top of the other. Then, while you keep your feet together, lift the upper knee away from the other knee, holding them apart for a count of 10 seconds. Repeat 5-10 times on each side. Slowly lower your knee back down. While performing this exercise, make sure that you do not roll your hips back.

3

Advanced Clams Exercise

Repeat 5-10 times

After mastering Clams, take it to the next level by lifting the knee and the foot of the upper leg. Again, hold the position for a count of 10 seconds. Lower it back down. Repeat 5-10 times for each leg to build strength and range of motion.

Shoulder Exercises

Many daily movements depend on shoulder strength such as grasping and releasing objects, moving the arms, and supporting weight with the arms. Occupational therapist Hoang Tran recommends six effective techniques based on the principles of gravity compensation to speed up recovery in the shoulders after a stroke.

Basic Shoulder Exercises

Though strokes are life-threatening and often cause irreversible neurological damage, you may be able to retrain other regions of your brain to make up for this damage. Your muscles must remain active if you hope to use them again, and some exercises aim to achieve this specific task. These two basic-level exercises are recommended for people who still struggle to move or use their shoulder after a stroke.

If you have completely or partially lost function – or even sensation – in one side of your body after your stroke, you still have a very powerful tool at your disposal: the other side of your body. The first exercise will help you use your functioning hand to stretch and stimulate your shoulder muscles. The second focuses on your shoulders themselves, specifically the muscles that allow you to move your shoulder blade on the unaffected side of your body.

1

Shoulder Shrug

15-20 times

Sit or stand in front of a mirror so that you can clearly see your entire upper body. Now, lift your unaffected shoulder up in a shrugging motion, just as you would if you didn't know the answer to a question. Instead of simply letting it drop again, roll your shoulder back. As you do so, your shoulder blades should get closer together. Repeat this exercise several times each day.

Towel Slide (Basic)

Repeat 10 times

Get a towel and sit down at a table, desk, or other flat surface. Fold or spread the towel, and make sure it's on the table immediately in front of you. Now, place your affected hand on the towel and put your unaffected hand directly on top of it. Apply enough pressure to keep your hands together, then use your hand to slide the towel away from you, toward the middle of the table.

As your hands move forward, your shoulders will also stretch forward, with the towel reducing friction and allowing your shoulder muscles to stretch and strengthen. If you feel comfortable leaning forward with your upper body, do so in order to slide the towel even farther forward. If you can do this until your arms are almost parallel with your body, the extra movement will allow you to stretch your shoulders at shoulder level, paving the way for a greater range of motion.

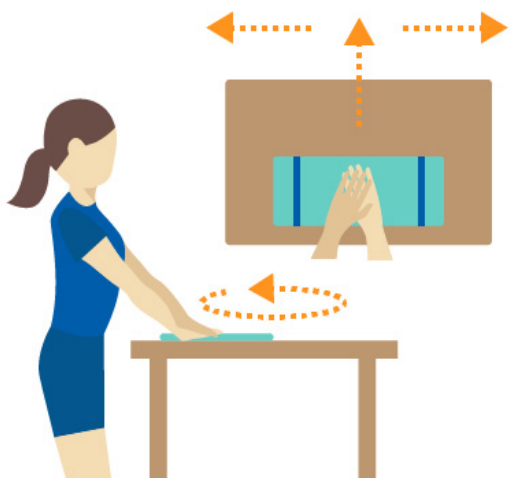

Intermediate Shoulder Exercises

These intermediate exercises are ideal if you've already made some progress toward shoulder mobility and control. If you cannot perform them, you may want to continue repeating the basic-level exercises, but don't forget to continue making attempts at these exercises too. They will require a towel, a table, and a cane or any other long, light object.

1

Towel Slides (Intermediate)

Repeat the exercise 10 times each direction

This exercise is very similar to the basic-level towel slide, but it incorporates a bigger range of motion by challenging you to stretch your shoulder muscles in more than one direction. Start by sitting at a table with a towel and placing your affected hand on it, as before. Now use your other hand to slide your hand forward, but don't simply slide it back toward you. Instead, follow this movement by sliding it from side to side. Now slide it back toward you and continue sliding the towel from side to side. Finally, incorporate all of these movements into a series of circular motions, alternating between clockwise and counterclockwise.

External Rotation with Cane

Repeat 10-20 times.

You'll need a cane or lightweight umbrella for this exercise. Hold the cane with both hands in front of your body with your arms bent at a 90-degree angle at your sides and your palms facing down.. Next, push the cane outward to your left and right without dropping your arms, so that the 90-degree angle remains consistent. Repeat 10-20 times. This exercise will improve your ability to perform external rotations with your shoulders, which are required for a significant number of everyday tasks.

Advanced Shoulder Exercises

Finally, a couple of advanced exercises are particularly useful for people who can already grasp objects with their affected hand and move their affected shoulder. If you still haven't regained complete range of motion in both shoulders, but you have enough strength and function to grab and reach in different directions, you may find these helpful. To perform them, you'll need at least five or six cups that can be stacked. Disposable plastic or paper cups are usually the most effective, because they're more lightweight than glasses or hard plastic cups.

1

Behind-the-Neck Cup Pass

Sit at a table and stack the cups right in front of you. Before you begin, remind yourself to keep looking forward throughout the exercise. It may help to train your sights on one specific point ahead of you, such as a painting on the wall or your own reflection in the mirror. Now, grab the first cup from the stack. While continuing to look forward, pass the cup behind your neck and use your other hand to retrieve it and set it back down on the table. Continue doing this until you've passed the entire stack of cups from one hand to the next.

2

Behind-the-Waist Cup Pass

Stand in front of the table, or sit on a stool or backless chair. Re-stack the cups on the table, and bring the first one behind your waist, passing it along the top of your pants line. Retrieve and replace it with the other hand, and repeat.

Reclaim Your Independence

Stroke survival rates have improved a lot over the last few years. Stroke was once the [third leading cause of death](#) in the United States, but it fell to [fourth place](#) in 2008 and [fifth place](#) in 2013. Today, strokes claim an average of 129,000 American lives every year. Reducing stroke deaths in America is a great improvement, but we still have a long way to go in improving the lives of stroke survivors.

Stagnant recovery rates and low quality of life for stroke survivors are unfortunately very common. Just 10% of stroke survivors make a [full recovery](#). Only 25% of all survivors recover with minor impairments. Nearly half of all stroke survivors continue to live with serious impairments requiring special care, and 10% of survivors live in nursing homes, skilled nursing facilities, and other long-term healthcare facilities. It's easy to see why [stroke is the leading cause of long-term disability](#) in the United States. By 2030, it's estimated that there could be up to 11 million stroke survivors in the country.

Stroke survivors do not have to assume that the struggles they have are permanent. Quality of life can be preserved with a proactive approach to stroke recovery. These at home exercises for stroke recovery combined with [Saebo products](#) can be some of the most effective techniques to reclaim your independence. Take back control and put recovery in your own hands with the help of [Saebo](#) and these exercises.
